Correspondence e-mail: t.chulkova@spbu.ru

Received 7 January 2014; accepted 15 January 2014

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.003 Å; R factor = 0.043; wR factor = 0.097; data-to-parameter ratio = 12.1.

The title compound, $C_{16}H_{12}N_2O$, exists in the crystalline state as the 5-imino-3,4-diphenyl-1*H*-pyrrol-2-one tautomer. The dihedral angles between the pyrrole and phenyl rings are 35.3 (2) and 55.3 (2)°. In the crystal, inversion dimers linked by pairs of N—H···N hydrogen bonds generate a graph-set motif of $R_2^2(8)$ *via* N—H···N hydrogen bonds.

5-Imino-3,4-diphenyl-1*H*-pyrrol-2-one

Evgeny Bulatov, Tatiana Chulkova and Matti Haukka

S1. Comment

The goal of this work was to determine which of the possible tautomers, *viz.* 5-Imino-3,4-diphenyl-1*H*-pyrrol-2-one or 5-amino-3,4-diphenyl-2H-pyrrol-2-one, is stabilized in the solid state.

In the title compound, the C1–N1 and C4–N1 bonds have the same length (1.380 (3) Å), which is longer than the C4–N2 bond length (1.271 (2) Å). In combination with the features of the difference Fourier map, this allows the unambiguous location of the hydrogen atom at the N1 atom. Thus, the title compound exists as 5-Imino-3,4-diphenyl-1*H*-pyrrol-2-one in the crystalline state. Two monomeric title compounds are linked together by hydrogen bonds N–H•••N making a graph-set motif of $R^2_2(8)$ (Table 1, Fig. 2).

S2. Experimental

3,4-Diphenyl-1*H*-pyrrol-2,5-diimine (0.121 mmol, 0.030 g) was hydrolyzed in undried chloroform (1 mL) for 1 week at room temperature. The yellow crystals of 5-Imino-3,4-diphenyl-1*H*-pyrrol-2-one were obtained from the reaction mixture.

S3. Refinement

The crystal of the title compound was immersed in cryo-oil, mounted in a Nylon loop, and measured at a temperature of 100 K. The X-ray diffraction data was collected on a Bruker Kappa Apex II diffractometer using MoKα radiation (λ = 0.71073 Å). The *APEX2* (Bruker AXS, 2010) program package was used for cell refinements and data reductions. The structure was solved by direct methods using the *SHELXS-97* (Sheldrick, 2008*a*) program. A multi-scan absorption correction based on equivalent reflections (*SADABS*, Sheldrick, 2008*b*) was applied to the data. Structural refinement was carried out using *SHELXL-97* (Sheldrick, 2008*a*) with the *Olex2* (Dolomanov *et al.*, 2009) and *SHELXLE* (Hübschle *et al.*, 2011) graphical user interfaces.

The NH hydrogen atoms were located from a difference Fourier map and refined isotropically. Other hydrogen atoms were positioned geometrically and were also constrained to ride on their parent atoms, with C–H = 0.95 Å and U_{iso} = 1.2 U_{eq} (parent atom). The highest peak is located 1.08 Å from atom H6 and the deepest hole is located 0.98 Å from atom N1.

$\mu = 0.08$ mm^{-1}
$T = 100$ K
Plate, yellow
0.12 × 0.10 × 0.07 mm

Data collection

Bruker KappaAPEXII diffractometer
Radiation source: fine-focus sealed tube
Horizontally mounted graphite crystal monochromator
Detector resolution: 9 pixels mm^{-1}
φ scans and ω scans with κ offset
Absorption correction: multi-scan (*SADABS*; Sheldrick, 2008*b*)
$T_{min} = 0.990$, $T_{max} = 0.994$
8351 measured reflections
2178 independent reflections
1360 reflections with $I > 2\sigma(I)$
$R_{int} = 0.050$
$\theta_{max} = 25.1°$, $\theta_{min} = 2.0°$
$h = -23\rightarrow20$
$k = -7\rightarrow7$
$l = -24\rightarrow24$

Refinement

Refinement on F^2
Least-squares matrix: full
$R[F^2 > 2\sigma(F^2)] = 0.043$
$wR(F^2) = 0.097$
$S = 1.00$
2178 reflections
180 parameters
0 restraints
Primary atom site location: structure-invariant direct methods
Secondary atom site location: difference Fourier map
Hydrogen site location: inferred from neighbouring sites
H atoms treated by a mixture of independent and constrained refinement
$w = 1/[\sigma^2(F_o^2) + (0.045P)^2 + 0.1005P]$ where $P = (F_o^2 + 2F_c^2)/3$
$(\Delta/\sigma)_{max} < 0.001$
$\Delta\rho_{max} = 0.17$ e Å^{-3}
$\Delta\rho_{min} = -0.18$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.
