

# **Design and synthesis of non-peptide integrin inhibitors**

Pro Gradu Thesis  
Jyväskylä University  
Department of Chemistry  
Section of Organic Chemistry  
8.6.2008  
Sari Norrlund

## Abstract

In the literature section journal articles involving the design and synthesis of nonpeptide inhibitors are presented. The articles were located by using the Internet and downloaded or retrieved from the libraries of Jyväskylä University and Oulu University.

The experimental section shows the attempted syntheses for a potential nonpeptide inhibitor for the integrin  $\alpha_{II}\beta_1$ . Professor Kari Rissanen designed 12 possible target molecules which were tested on a computer model of integrin  $\alpha_{II}\beta_1$  by Bio-Tie Therapies. 10 molecules showed at least some binding potential due to their suitable size, flexibility and three branches with negative charges.

Due to the limited time available only syntheses of molecule **669** and modified versions of molecules **673** and **677** were attempted.

It was attempted to test the reduction reaction on the small molecule **680** with a cyano group and an ester bond in order to see whether the ester bond would tolerate the conditions without breaking. The synthesis of *p*-ethyl ester benzyl amine **682'** was unsuccessfully attempted.

The synthesis of target molecule **669** failed.

Target molecule **673**:

The synthesis of 4-cyano benzyl bromide **685** was successful but the synthesis of diketone **688** failed.

Target molecule **677**:

The synthesis of diol **690** was successful but the synthesis of molecule **691**, modified version of molecule **677**, failed.

## **Foreword**

The articles studied were located in the Internet using the SciFinder Scholar program and downloaded or retrieved from the libraries of Jyväskylä University and Oulu University.

The experimental section was carried out in the fall of 2001 at Jyväskylä University in co-operation with Bio-Tie Therapies

The counselor and supervisor for the thesis was professor Kari Rissanen (Department of Chemistry, Section of Organic Chemistry at Jyväskylä University).

## 1 Preface

For the literature section of the thesis scientific journals were investigated to find synthesis routes for non-peptide integrin inhibitors. The inhibitors were then divided into several subsidiary groups according to their chemical structure. Since many molecules could have been listed under two or more groups, there is some overlapping. Most of the research concerning non-peptide integrin inhibitors is focused on the RGD (Arg-Gly-Asp) sequence which is recognized by the platelet fibrinogen receptor  $\alpha_{IIb}\beta_3$  (GPIIb/IIIa) and the vitronectin receptor  $\alpha_V\beta_3$ .<sup>5</sup>

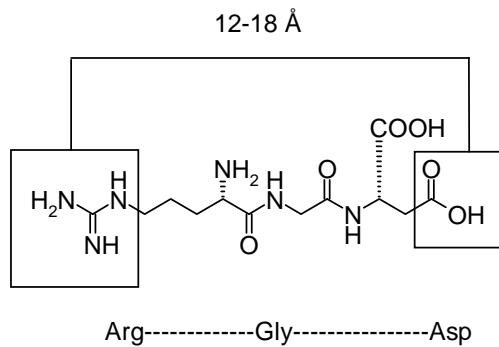

Figure 1.<sup>1</sup> RGD sequence.

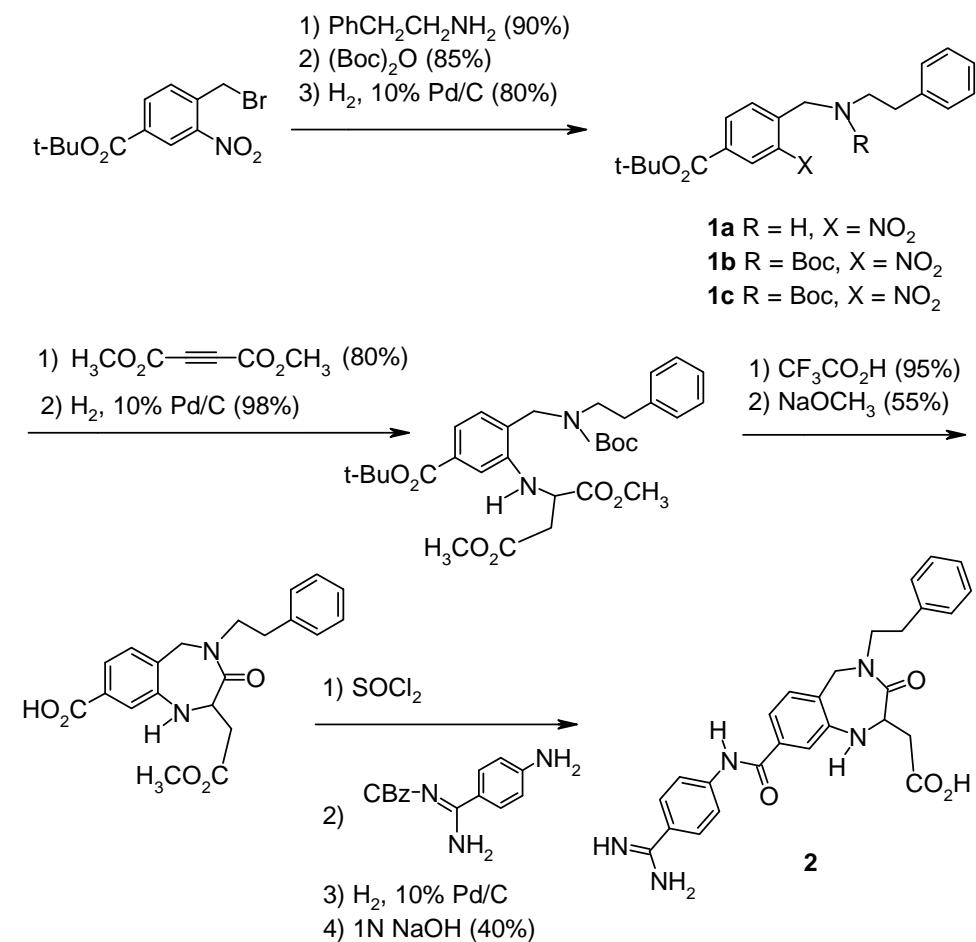

The RDG sequence plays a key part in aggregation of platelets causing vaso-occlusive disorders such as unstable angina, myocardial infarction, transient ischemic attacks, stroke and thrombosis ( $\alpha_{IIb}\beta_3$ ).<sup>32,36</sup> Also, it's involved in osteoclast-mediated bone resorption -  $\alpha_V\beta_3$  is present in osteoclasts but not bone forming osteoblasts.<sup>39</sup> Cyclic peptides with RGD are potent inhibitors, which has led to the search for non-peptidomimetic inhibitors.<sup>34</sup> There are significant structural differences between RGD-containing cyclic peptides which makes it very difficult to design a single molecular pharmacophore for fibrinogen or vitronectin receptor binding.<sup>4</sup>

The less studied  $\alpha_V\beta_1$ , VLA-4 (very late antigen 4) found in stimulated monocytes and lymphnotes binds to cytokine-activated endothelial cells and to fibronectin causing diseases such as asthma and multiple sclerosis.<sup>43</sup>

## 2 Benzodiazepine and benzazepine compounds

### 2.1 Compounds containing a benzamidine or *p*-cyanophenyl unit

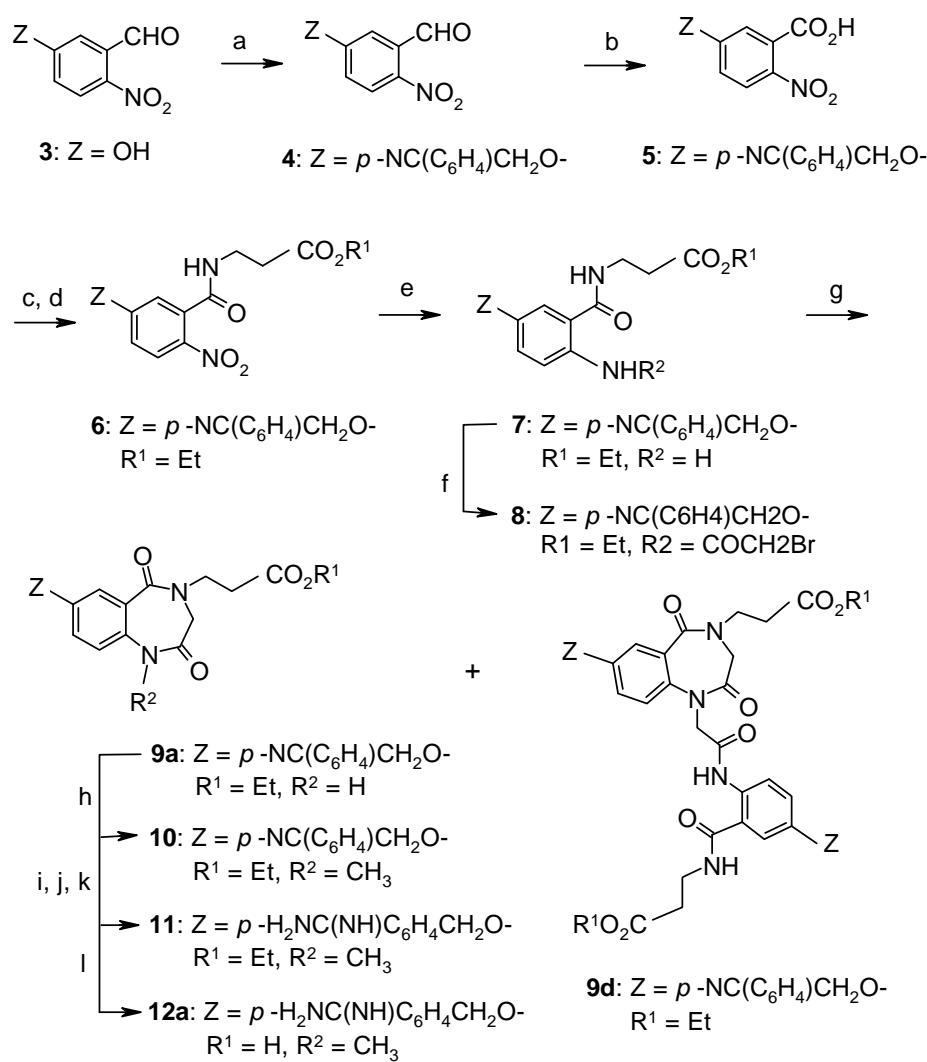

Ku *et al.* have designed a high-affinity, potent, non-peptide GPIIb/IIIa antagonist **2** based on the stucture of a constrained RGD-containing cyclic peptide.<sup>2</sup>

Scheme 1. The synthesis of molecule **2**.<sup>2</sup>

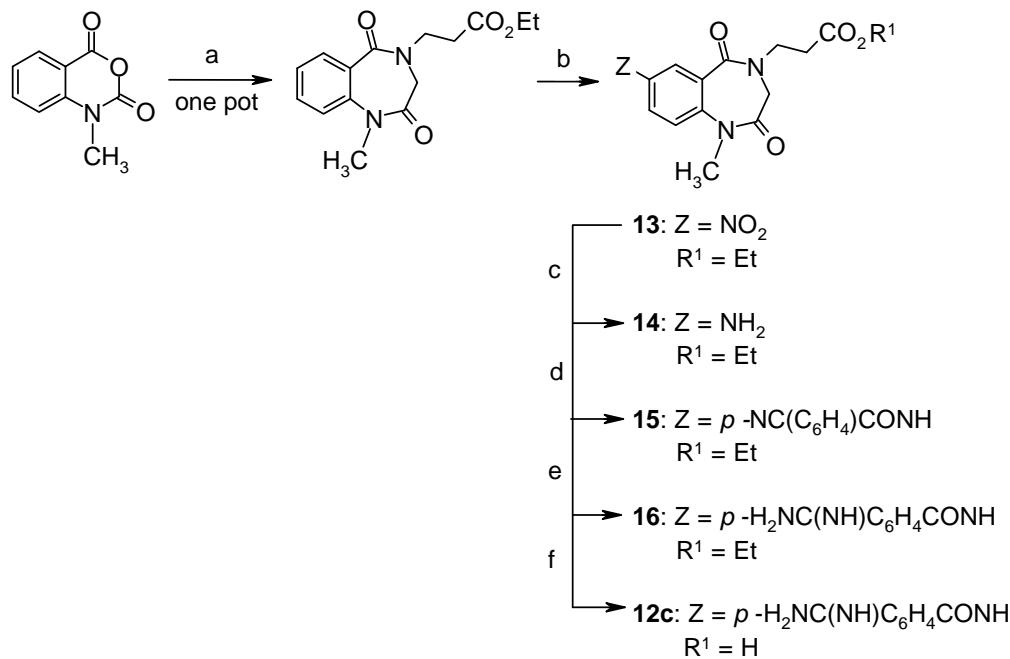

Ku *et al.* found that the 1,4-benzodiazepine nucleus helps mimic the C-7 turn around Asp and the extended Gly residue thus providing conformational rigidity.

Robarge *et al.* have synthesized several potent tricyclic GPIIb/IIIa antagonists.<sup>3</sup> According to retrosynthetic analysis the required precursors for the benzyloxy, ethynyl and amide series of tricyclic GPIIb/IIIa antagonists were secondary amines **9a-c**, Schemes 3, 4 and 16.

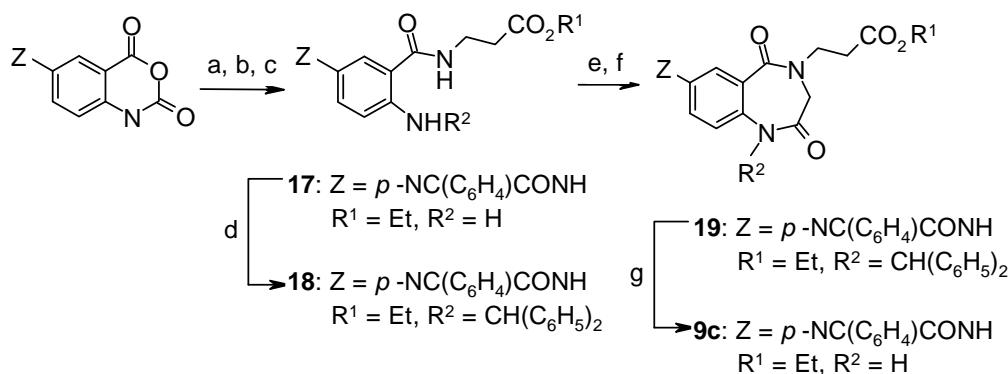

(a) K<sub>2</sub>CO<sub>3</sub>, DMF, *p*-NC(C<sub>6</sub>H<sub>4</sub>)CH<sub>2</sub>Br, 104%; (b) KMnO<sub>4</sub>, Bu<sub>4</sub>NBr, H<sub>2</sub>O, C<sub>5</sub>H<sub>5</sub>N, 45% (ratio of 5/*p*-NC(C<sub>6</sub>H<sub>4</sub>)CO<sub>2</sub>H, ca. 5/1); (c) (COCl)<sub>2</sub>, C<sub>6</sub>H<sub>6</sub>, DMF, 65°C; (d) ClH<sub>3</sub>NCH<sub>2</sub>CH<sub>2</sub>CO<sub>2</sub>Et, NaHCO<sub>3</sub>, THF/H<sub>2</sub>O (1/2), 94%; (e) SnCl<sub>2</sub>, H<sub>2</sub>O, EtOAc/EtOH; (f) BrCOCH<sub>2</sub>Br, H<sub>2</sub>O/CH<sub>2</sub>Cl<sub>2</sub>, triturate w/ EtOH to purify (or recrystallize from EtOH), 50-70%; (g) powdered K<sub>2</sub>CO<sub>3</sub>/DMF (0.018-0.026 M), 50°C, 2-3 h, 53-77%; (h) MeI, Cs<sub>2</sub>CO<sub>3</sub>, DMF, rt, 75%; (i) pyridine/Et<sub>3</sub>N(1/1), H<sub>2</sub>S, 50°C, 4 h; (j) CH<sub>2</sub>Cl<sub>2</sub>/MeI (5/1), sealed tube, 50°C, 1 h; (k) NH<sub>4</sub>OAc (xs), MeOH, 50°C, 12 h, RP HPLC, 64% (overall from 10); (l) THF/NaOH (aq. 4.2 equiv.), RP HPLC, 75%.

Robarge *et al.* found that a tricyclic scaffold may be optimal for steric reasons since the tetracyclic quinazoline **27e** exhibited a dramatic decrease (100-fold) in activity.<sup>3</sup>

Scheme 10. Synthesis of triazole tricyclic compounds **27a** and **27b**.<sup>3</sup>

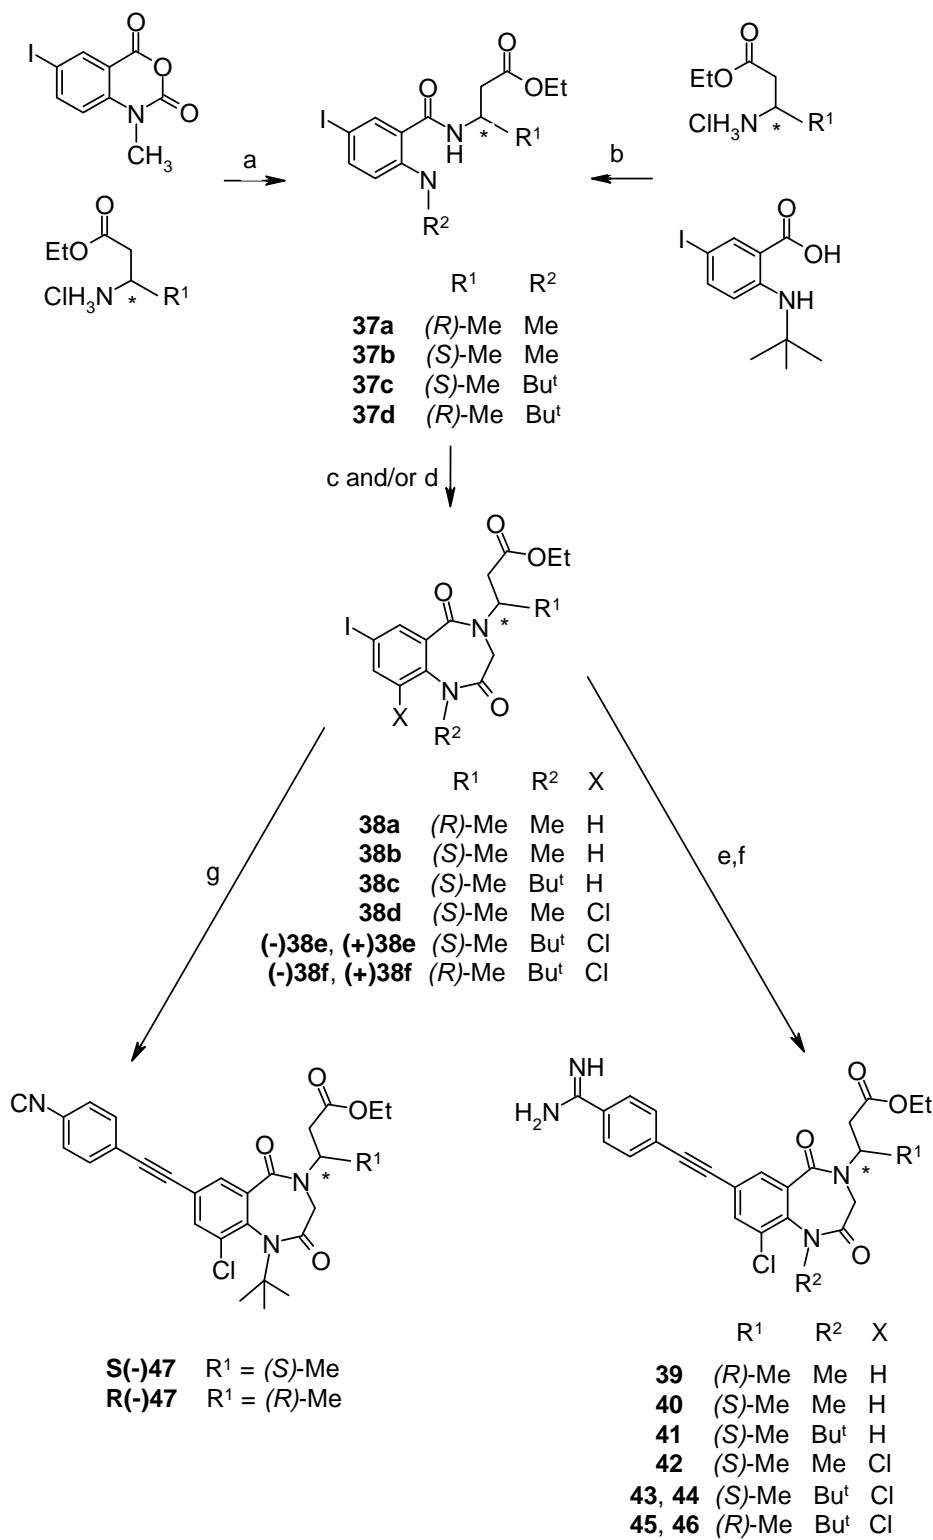

The most potent antagonist of the series was tricyclic **27i** with an amide linker at C<sup>7</sup> and a tetrazole heterocycle. Tricyclic antagonists **27a**, **27b**, **27d** and **27f-j** exhibited a retention of potency (i.e. less than a twofold decrease) relative to the comparative bicyclic progenitor.<sup>3</sup> **27c** was the exception exhibiting a fourfold loss in potency relative to **12a**.

Scheme 11. Improved synthesis of tricyclic tetrazole **27i**.<sup>3</sup>

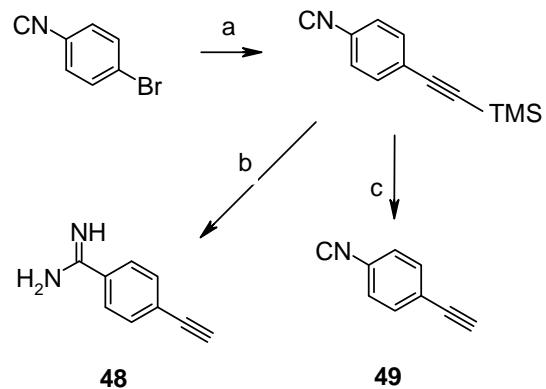

Blackburn *et al.* have designed and synthesized a benzodiazepinedione group of GPIIb/IIIa antagonists derived from the RGD-containing cyclic peptide G4120.<sup>4</sup> They studied the effect of chiral substitution at C-11 by comparing compounds **39** and **40** in the protein-protein assay (ELISA) and physiologically relevant (PRP) platelet aggregation assay. They found **40** to be 10-fold more potent than its enantiomer **39**.<sup>4</sup> The absolute configuration of **40** is in contrast to the stereochemical preference for peptidal and other non-peptidal GPIIb/IIIa antagonists.<sup>4</sup>

(a) DMF or  $\text{CH}_2\text{Cl}_2$ ,  $\text{Et}_3\text{N}$ , DMAP; (b) EDC, HOBT,  $\text{Et}_3\text{N}$ ; (c)  $\text{Cl}_2$ , AcOH; (d) i.  $\text{BrCH}_2\text{COBr}$ , ii.  $\text{Cs}_2\text{CO}_3$ , DMF or DBU,  $\text{CH}_2\text{Cl}_2$  or  $\text{C}_6\text{H}_5\text{CH}_3$ ; (e) Pd(II), Cu(I),  $\text{Et}_3\text{N}$ , **48**, DMF; (f) LiOH; (g) Pd(II), Cu(II),  $\text{Et}_3\text{N}$ , **49**, EtOAc.

Scheme 12. Synthesis of benzodiazepinediones **39-46**, **S(-)47** and **R(-)47**.<sup>4</sup>

Compound **43** was found to be a conformationally rigid and potent GPIb/IIIa antagonist.

(a) Pd(II), Cu(I), Et<sub>3</sub>N, trimethylsilylacetylene, EtOAc; (b) i. H<sub>2</sub>S, pyridine, ii. MeI, iii. NH<sub>4</sub>OAc, EtOH;  
(c) K<sub>2</sub>CO<sub>3</sub>, MeOH.

Scheme 13. Synthesis of 4-ethynylbenzamidine **48** and 4-ethynylbenzonitrile **49**.<sup>4</sup>

Keenan *et al.* have synthesized potent and selective  $\alpha_v\beta_3$  antagonists.<sup>5</sup> Compounds **50** and **51** (Fig. 2), **56** and **57** (Fig. 4) and **58-63** (Fig. 5) were synthesized by coupling of the appropriate amine to the 1,4-benzodiazepine-7-carboxylic acid as seen in Scheme 18. Keenan *et al.* gathered evidence that the length required for optimal binding to  $\alpha_v\beta_3$  is shorter than for  $\alpha_{IIb}\beta_3$ .<sup>5</sup>

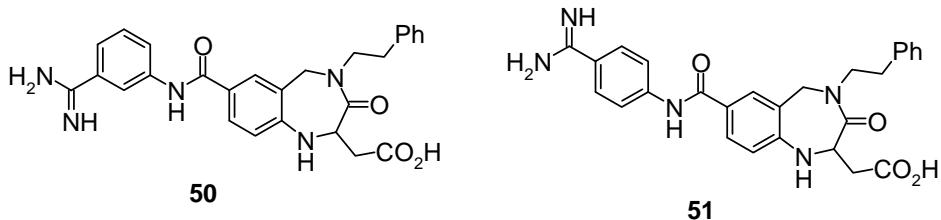

Figure 2. Benzamidine-containing  $\alpha_v\beta_3$  antagonists.<sup>5</sup>

Having a shorter distance between the carboxyl terminus and the amidine terminus, *m*-benzamidine **50** showed greater affinity for  $\alpha_v\beta_3$  than for  $\alpha_{IIb}\beta_3$ , and *p*-benzamidine **51** was found to be a potent  $\alpha_{IIb}\beta_3$  antagonist.<sup>5</sup>

Samanen *et al.* have investigated and synthesized potent, selective 3-oxo-1,4-benzodiazepine GPIIb/IIIa integrin antagonists.<sup>6</sup>

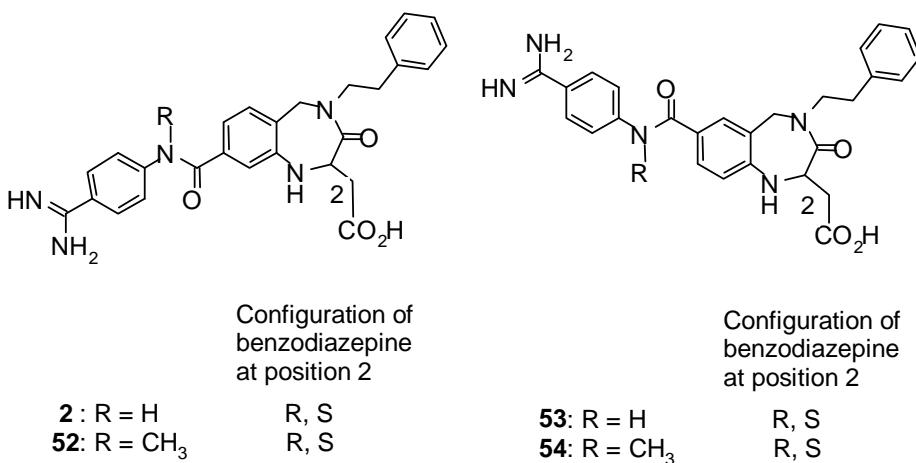

Figure 3. 3-oxo-1,4-benzodiazepine GPIIb/IIIa antagonists.<sup>6</sup>

## 2.2 Compounds containing a piperazine unit

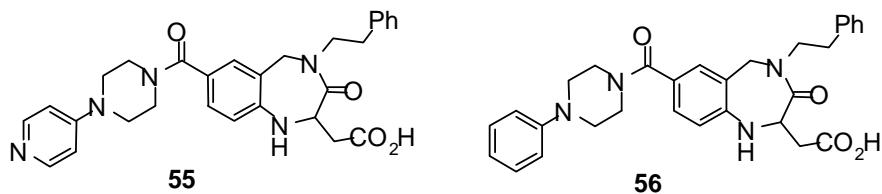

Figure 4. Piperazine-containing  $\alpha_v\beta_3$  antagonists.<sup>5</sup>

Keenan *et al.* discovered that the pyridyl nitrogen in **55** was responsible for the much greater affinity for  $\alpha_{IIb}\beta_3$  compared to that of **56**.<sup>5</sup> The affinities of the two compounds for  $\alpha_v\beta_3$  were comparable, caused by the central anilino nitrogen.<sup>5</sup>

### 2.3 Compounds containing a benzimidazole unit

Keenan *et al.* have synthesized a highly potent and selective  $\alpha_v\beta_3$  antagonist **62**.<sup>5</sup>

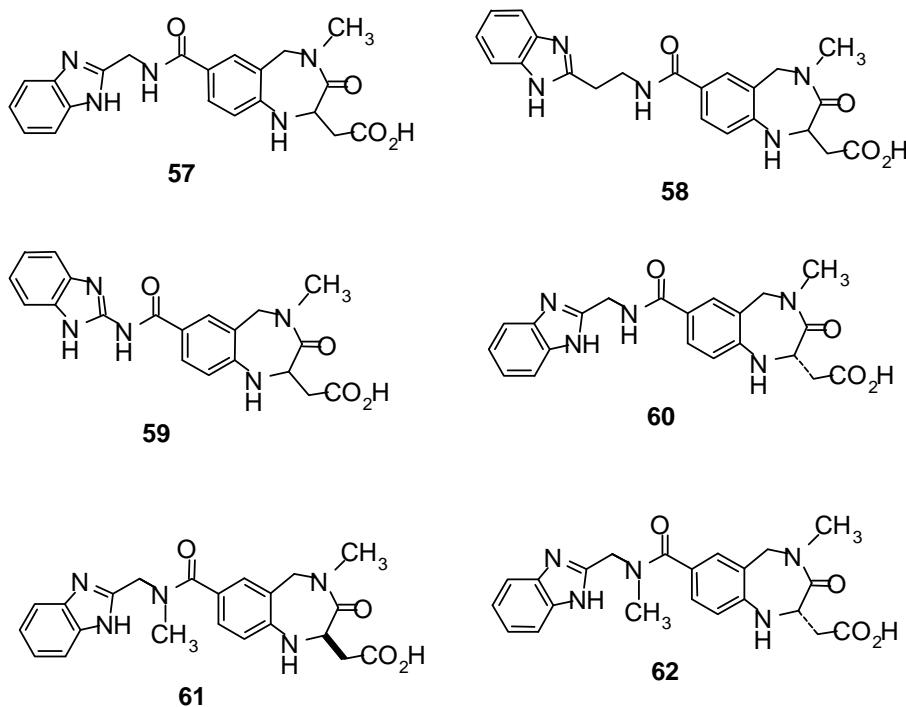

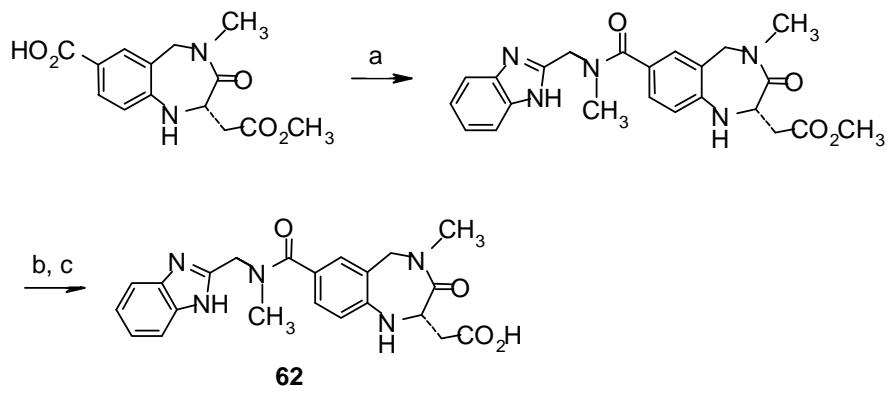

Figure 5. Benzimidazole-containing  $\alpha_v\beta_3$  antagonists.<sup>5</sup>

Keenan *et al.* found **57** to be a potent and selective  $\alpha_v\beta_3$  antagonist partly due to its optimal length.<sup>5</sup> They also found the (*S*)-enantiomer **60**, identical to the natural configuration of Asp, to be almost entirely responsible for the affinity thus providing further evidence of the 1,4-benzodiazepine acting as a Gly-Asp mimic.<sup>5</sup> In their previous work Keenan *et al.* had discovered increased affinity due to amide N-methylation. Based on this information they synthesized **62**, a highly potent and selective  $\alpha_v\beta_3$  antagonist.<sup>5</sup>

(a) 2-(methylaminomethyl)benzimidazole • TFA, DCC, (i-Pr)<sub>2</sub>NEt, DMF (100%); (b) 2 N NaOH, MeOH;  
 (c) HCl to pH 6.0 (71%).

Scheme 14. Synthesis of  $\alpha_v\beta_3$  antagonist **62**.<sup>5</sup>

Miller *et al.* have synthesized a series of highly potent, orally active small molecule  $\alpha_v\beta_3$  antagonists (Fig. 6, 8 and ) based on a 2-benzazepine Gly-Asp.<sup>7</sup>

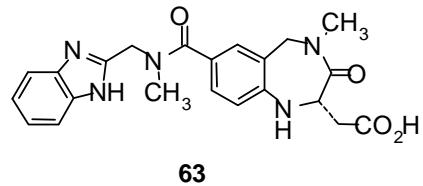

Figure 6. A potent  $\alpha_v\beta_3$  antagonist.<sup>7</sup>

## 2.4 Compounds containing a piperidine unit

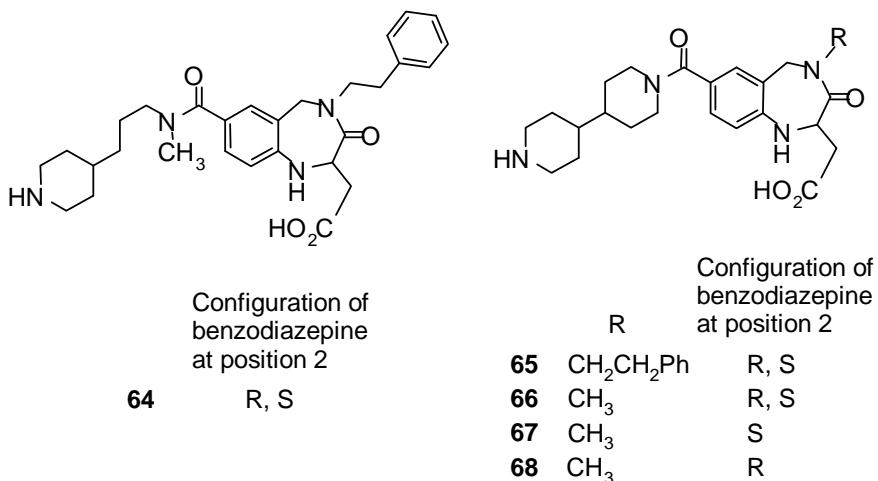

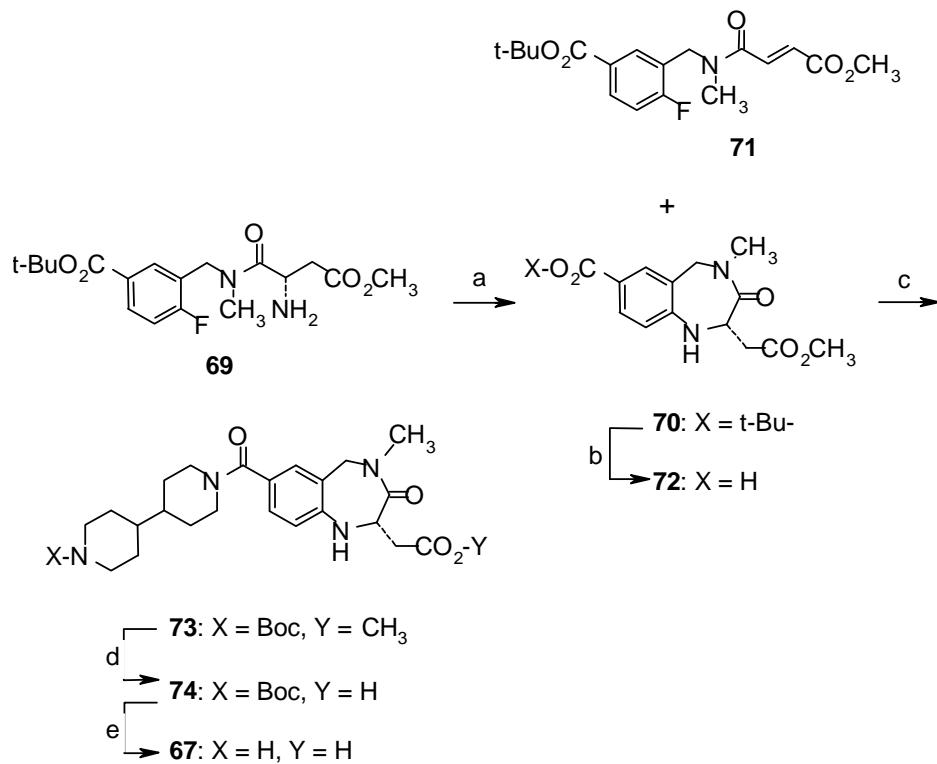

Figure 7. 3-oxo-1,4-benzodiazepine GPIIb/IIIa antagonists by Samanen *et al.*<sup>6</sup>

Compound **64** was found to have high affinity for GPIIb/IIIa and high potency in the platelet aggregation assay. Also **65** is a potent GPIIb/IIIa antagonist.<sup>6</sup> Compound **67** is a potent, orally active antiaggregatory agent. Its *R*-enantiomer **68** has considerably lower affinity.

(a) 0.1 M **69** in anhydrous DMSO, 125°C (47% of **70**, 28% of **71**); (b) 1:1 TFA/CH<sub>2</sub>Cl<sub>2</sub>, anisole (95%); (c) 1-Boc-4,4'-bipiperidine, EDC, (*i*-Pr)<sub>2</sub>NEt, DMF (94%); 2.0 N NaOH (2 equiv.), 1:1 MeOH/THF, then AcOH (81%); (e) 4 M HCl in dioxane, CHCl<sub>3</sub>, then neutralization of excess reagent with ca. 1.0 N KOH in EtOH to give **67**-HCl (75%) and precipitation from aqueous solution at pH 6.8 (83%).

Scheme 15. Homochiral synthesis of 3-oxo-1,4-benzodiazepine **67**.<sup>6</sup>

## 2.5 Compounds containing a pyridine unit

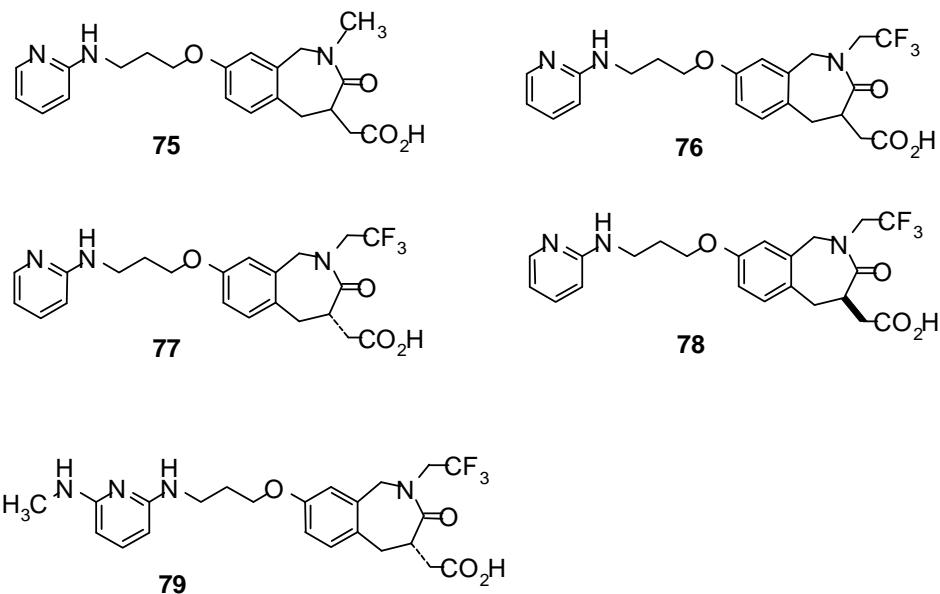

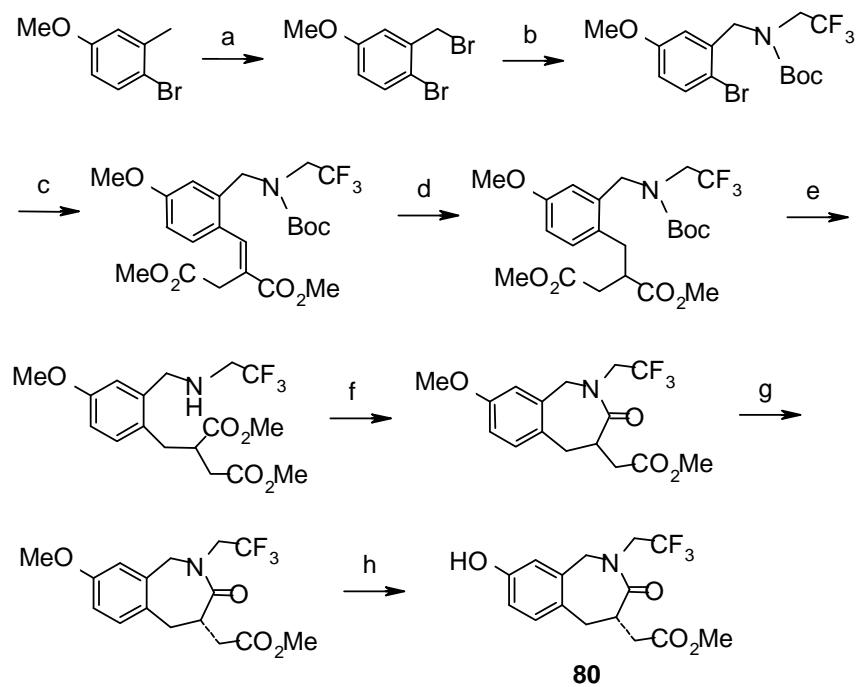

Figure 8.  $\alpha_V\beta_3$  antagonists synthesized by Miller *et al.*<sup>7</sup>

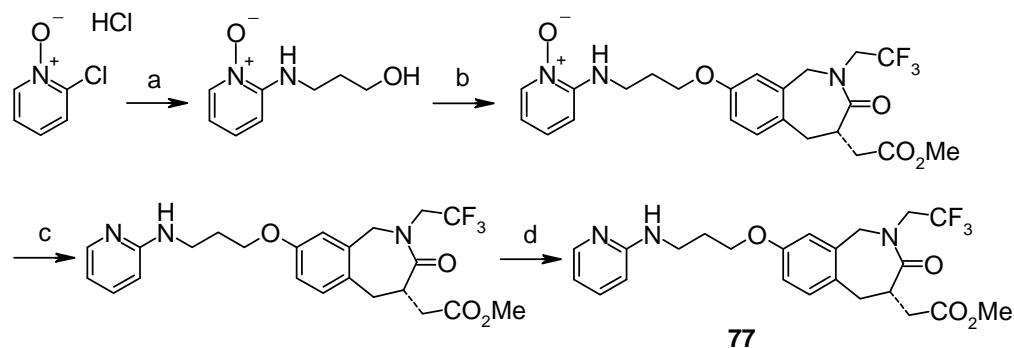

The *S*-enantiomer of **76**, compound **77** has greater affinity for  $\alpha_V\beta_3$  than the *R*-enantiomer **78**. Miller *et al.* also discovered compounds **77** and **79** to have great affinity for  $\alpha_V\beta_5$ , and minimal affinity for both  $\alpha_{IIb}\beta_3$  and  $\alpha_V\beta_1$ .<sup>7</sup>

Miller *et al.* found proof that *in vitro* biological activity and oral bioavailability of benzazepine-based antagonists may be improved by increasing lipophilicity by appropriate manipulation of the 2-position substitute.<sup>7</sup>

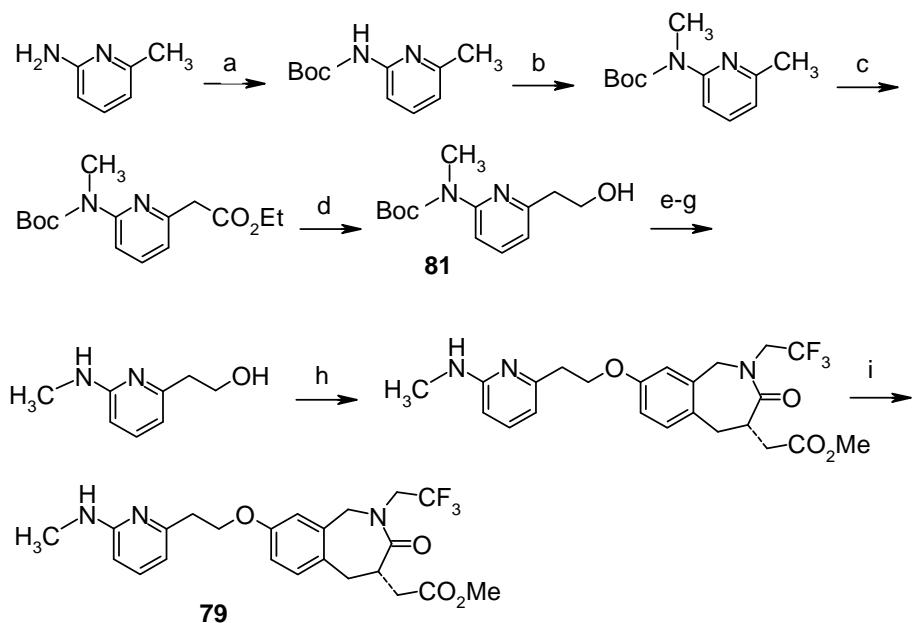

(a) NBS, (BzO)<sub>2</sub>,  $h\nu$ , CH<sub>2</sub>Cl<sub>2</sub> (81%); (b) NaN(Boc)CH<sub>2</sub>CF<sub>3</sub>, DMF (77%); (c) dimethyl itaconate, Pd(OAc)<sub>2</sub>, P(*o*-tol)<sub>3</sub>, (*i*-Pr)<sub>2</sub>NEt, CH<sub>3</sub>CH<sub>2</sub>CN, reflux (92%); (d) H<sub>2</sub>, Pd/C, EtOAc (90%); (e) TFA, anisole, CH<sub>2</sub>Cl<sub>2</sub> (86%); (f) (*n*-Pr)<sub>3</sub>N, TFA, xylenes, reflux (81%); (G) chiral HPLC (46%, 99+% ee); (h) BBr<sub>3</sub>, CH<sub>2</sub>Cl<sub>2</sub> (99%).

Scheme 16. The synthesis of starting material **80**.<sup>7</sup>

(a) 3-Amino-1-propanol, NaHCO<sub>3</sub>, *tert*-amyl alcohol, reflux (96%); (b) **80**, Ph<sub>3</sub>P, DIAD, THF (75%); (c) cyclohexene, 10% Pd/C, *i*-PrOH, reflux (76%); (d) 1.0 N NaOH, dioxane, then 1.0 N HCl (86%).

Scheme 17. The synthesis of highly potent  $\alpha_V\beta_3$  antagonist **77**.<sup>7</sup>

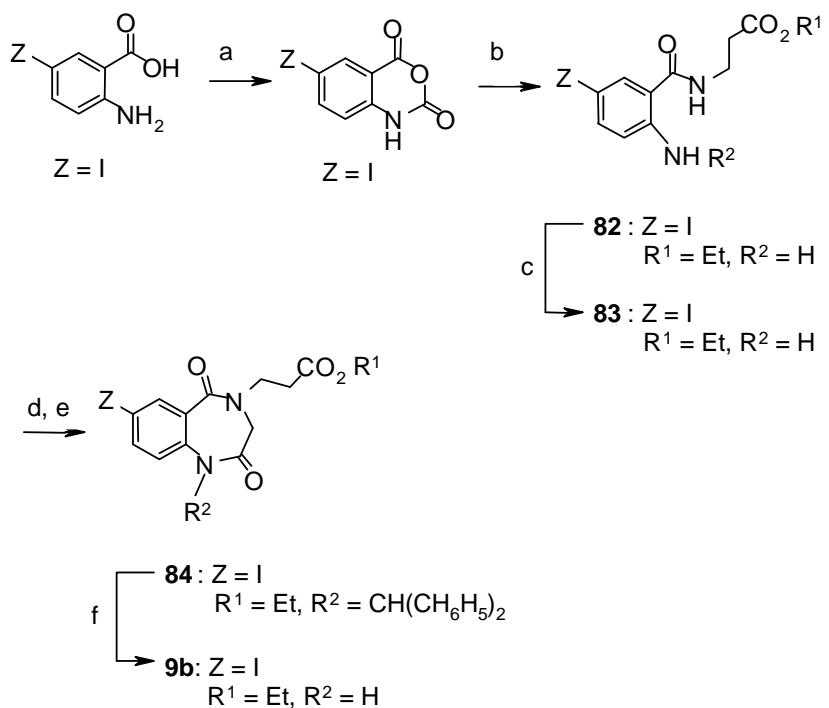

(a) (Boc)<sub>2</sub>O, neat, 50°C (99%); (b) NaH, CH<sub>3</sub>I, DMF (87%); (c) LDA, (EtO)<sub>2</sub>C=O, THF, 0°C (100%);  
 (d) LiBH<sub>4</sub>, THF, reflux (100%); (e) 4 N HCl/dioxane, anisole, then aq. NaOH; (f) HCO<sub>2</sub>H, EtOAc;  
 (g) aq. NH<sub>4</sub>OH (52% from **81**); (h) **80**, Ph<sub>3</sub>P, DIAD, THF (91%); (i) 1.0 N NaOH, MeOH, then acetic acid (82%).

Scheme 18. The synthesis of highly potent  $\alpha_V\beta_3$  antagonist **79**.<sup>7</sup>

## 2.6 Other benzodiazepine compounds

As reported in 2.1, **9b** is one of the required precursors for the benzyloxy, ethynyl and amide series of tricyclic GPIIb/IIIa antagonists portrayed by Robarge *et al.*<sup>3</sup>

(a)  $\text{K}_2\text{CO}_3/\text{H}_2\text{O}$ ,  $0^\circ\text{C}$ ,  $\text{COCl}_2$ , 84%; (b)  $\text{ClH}_3\text{NCH}_2\text{CH}_2\text{CO}_2\text{Et}$ ,  $\text{DMF}$ ,  $\text{Et}_3\text{N}$ , DMAP (cat.), 90%; (c)  $\text{Ph}_2\text{CHCl}$ , 2,6-lutidine,  $\text{DMF}$ ,  $50^\circ\text{C}$ , 56%; (d)  $\text{BrCH}_2\text{COBr}$ ,  $\text{CH}_2\text{Cl}_2/\text{H}_2\text{O}$ , rt; (e)  $\text{NaH}$ ,  $\text{DMF}$ ,  $48^\circ\text{C}$  from **83**; (f)  $\text{HF}$  (g), anisole,  $\text{H}_3\text{CCH}_2\text{SCH}_3$ ,  $-196^\circ\text{C}$ , 80% or  $\text{TFA/Et}_3\text{SiH}$  (3/1), reflux, 16 H, 40%.

Scheme 19. Synthesis of benzodiazepinedione **9b**.<sup>3</sup>

### 3 Isoxazoline and oxazolidinone compounds

#### 3.1 Isoxazoline and oxazolidinone compounds containing a benzamidine unit

Xue *et al.* have designed a series of potent GPIIb/IIIa antagonists based on XR299 (**85a**). They studied the effect on activity of lipophilic  $\alpha$ - and  $\beta$ -substitution of the carboxylate moiety.<sup>8</sup>

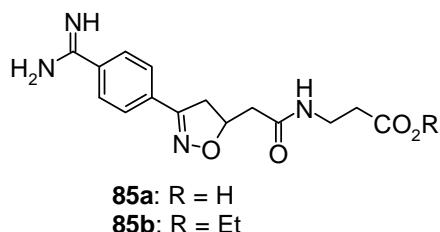

Figure 9. A selective GPIIb/IIIa antagonist.<sup>8</sup>

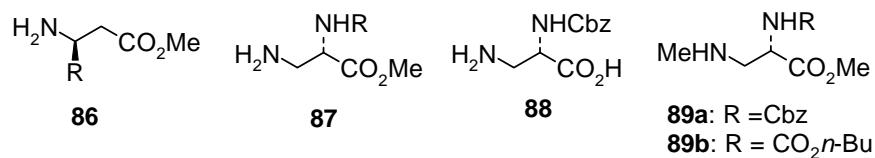

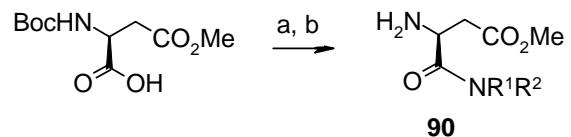

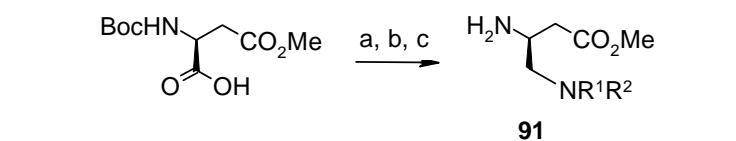

Figure 10. Starting material for the synthesis of substituted  $\beta$ -alanines.<sup>8</sup>

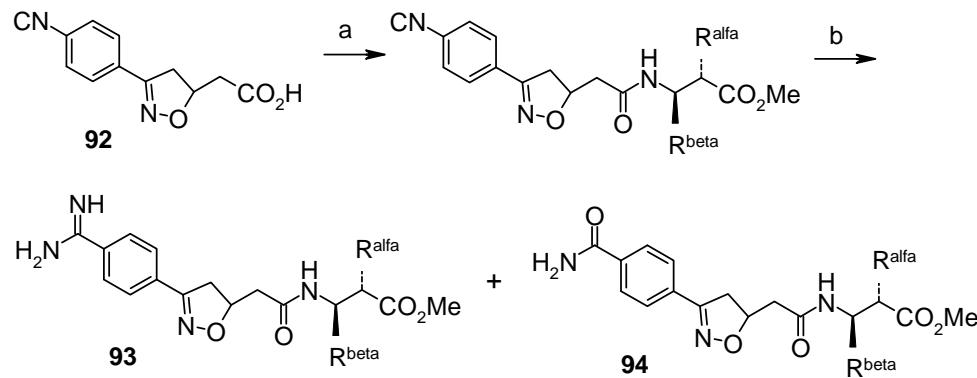

(a)  $\text{NHR}^1\text{R}^2$ ,  $\text{Et}_3\text{N}$ , TBTU, EtOAc; (b) 4 M HCl-dioxane.

Scheme 20. Preparation of aspartic acid  $\beta$ -amides.<sup>8</sup>

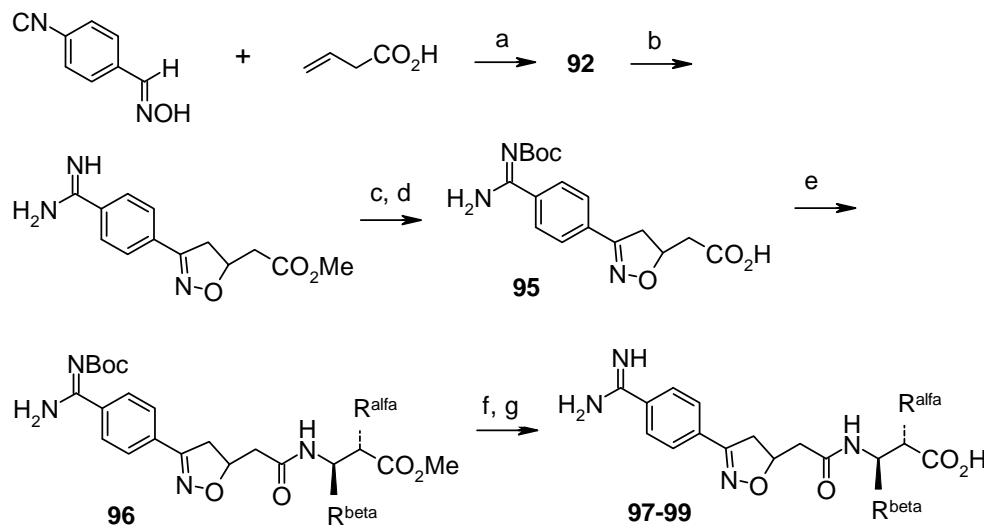

(a)  $\text{NHR}^1\text{R}^2$ ,  $\text{Et}_3\text{N}$ , TBTU, EtOAc; (b)  $\text{BH}_3$ -THF; (c) 4 M HCl-dioxane.

Scheme 21. Synthesis of  $\beta$ -(aminomethyl)- $\beta$ -alanines.<sup>8</sup>

(a) **86**, **87**, **90**, or **91**, TBTU, DMF, Et<sub>3</sub>N; (b) HCl(anhyd), MeOH, 0 °C, then NH<sub>3</sub>, MeOH, 0 °C.

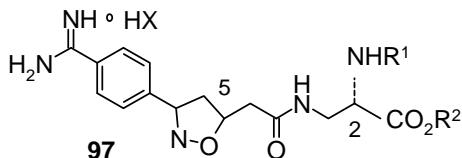

Scheme 22. Early method for synthesis of isoxazolinylacetamides.<sup>8</sup>

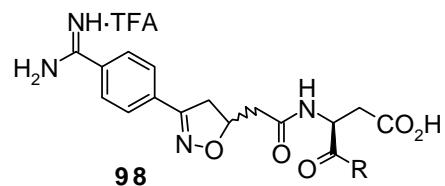

(a) Clorox, THF; (b) HCl(anhyd), MeOH, 0 °C, then NH<sub>3</sub>, MeOH, 0 °C; (c) Boc<sub>2</sub>O, Et<sub>3</sub>N, DMF; (d) LiOH, MeOH-H<sub>2</sub>O; (e) **86**, **87**, **90**, or **91**, TBTU, DMF, Et<sub>3</sub>N, DMF; (f) TFA, CH<sub>2</sub>Cl<sub>2</sub>; (g) ester hydrolysis: saponification using lithium hydroxide in aqueous methanol, acidic hydrolysis using aqueous 6 M HCl in dioxane or 40% conc. HCl/formic acid, or esterase hydrolysis using rabbit liver esterase.

Scheme 23. Convergent method for preparation of isoxazolinylacetamides.<sup>8</sup>

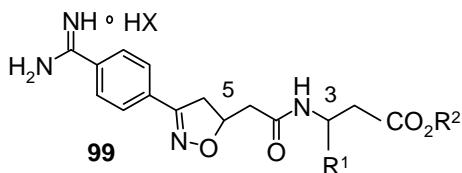

Xue *et al.* found that lipophilic substituents placed  $\alpha$  (**97a-z**, Table 4) or  $\beta$  (**98a-g**, Table 5 and **99a-m**, Table 6) to the carboxylate moiety resulted in increased potency in most cases.<sup>8</sup>

<b>126f</b>	$\text{CO}_2\text{CH}_2\text{Ph}$	2	1
<b>126g</b>	$\text{CO}_2(\text{CH}_2)_3\text{CH}_3$	3	1

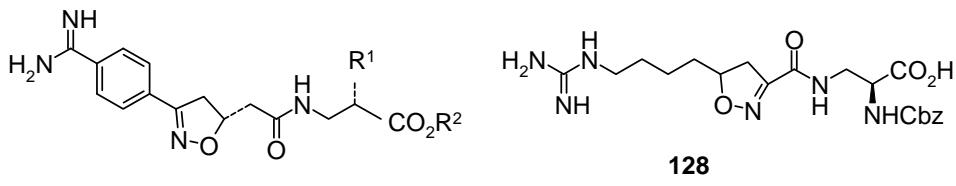

Piperidines **126a-g** were prepared in a fashion similar to that depicted in Scheme 23.

Xue *et al.* found that the replacement of the 4-amidinophenyl group of **127** with the *N*-amidinopiperidin-4-yl group in **128** resulted in a fourfold loss in the platelet aggregation inhibitory activity.<sup>10</sup>

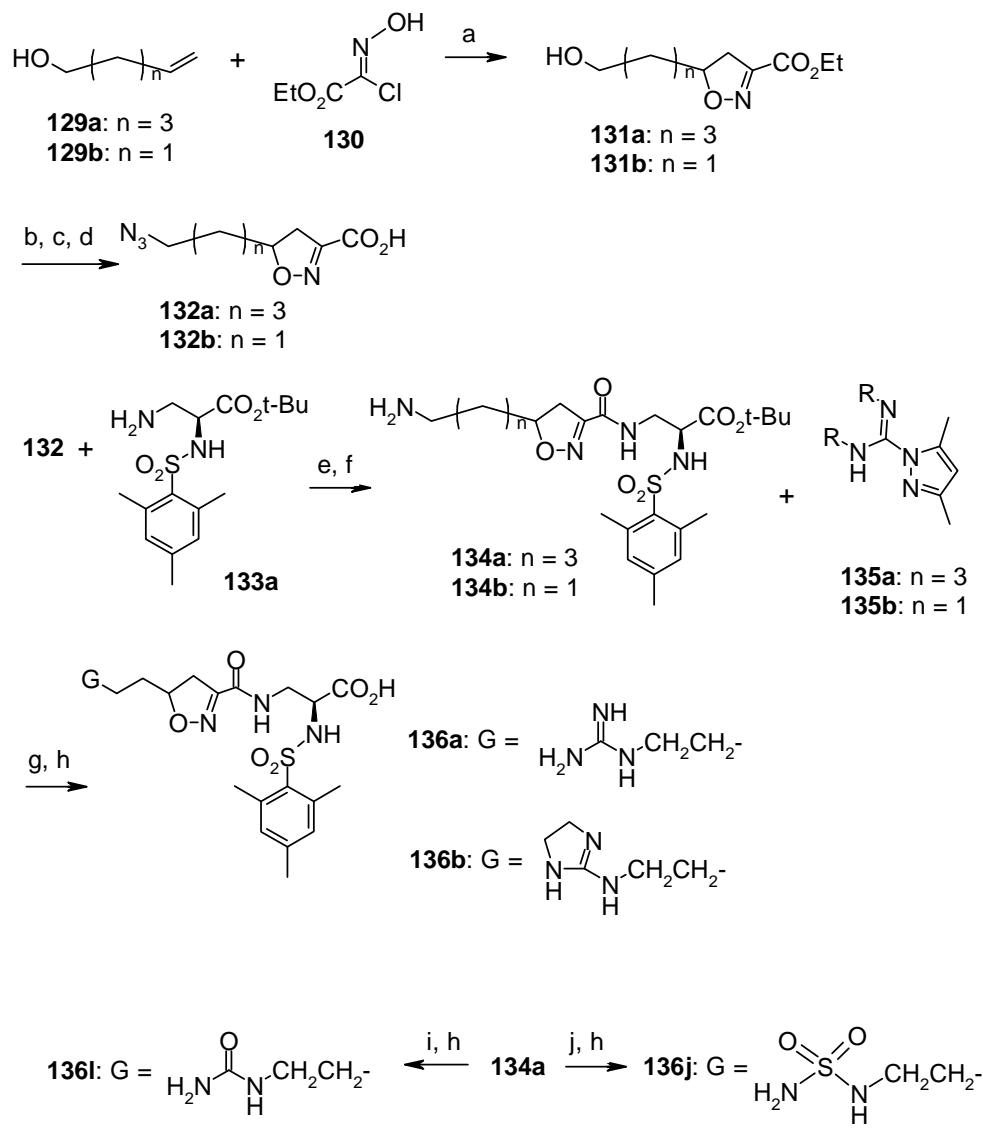

Scheme 32. Synthesis of *N*-amidinopiperidine **127**.<sup>10</sup>

Pitts *et al.* studied the effects of structural changes in the guanidine mimetic and the substituent  $\alpha$  to the carboxylate in order to find a highly selective integrin  $\alpha_V\beta_3$  antagonist.<sup>12</sup>

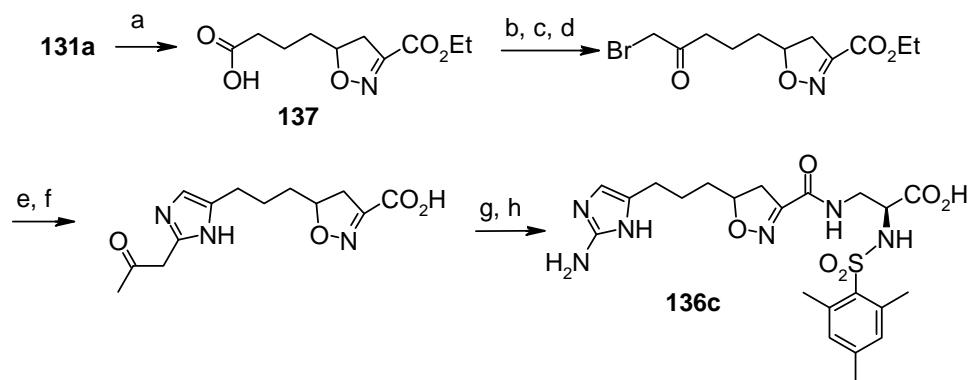

**85c:**  $\text{R}^1 = \text{NHCO}_2n\text{-Bu}$ ,  $\text{R}^2 = \text{Me}$

## 4 Hydantoin compounds

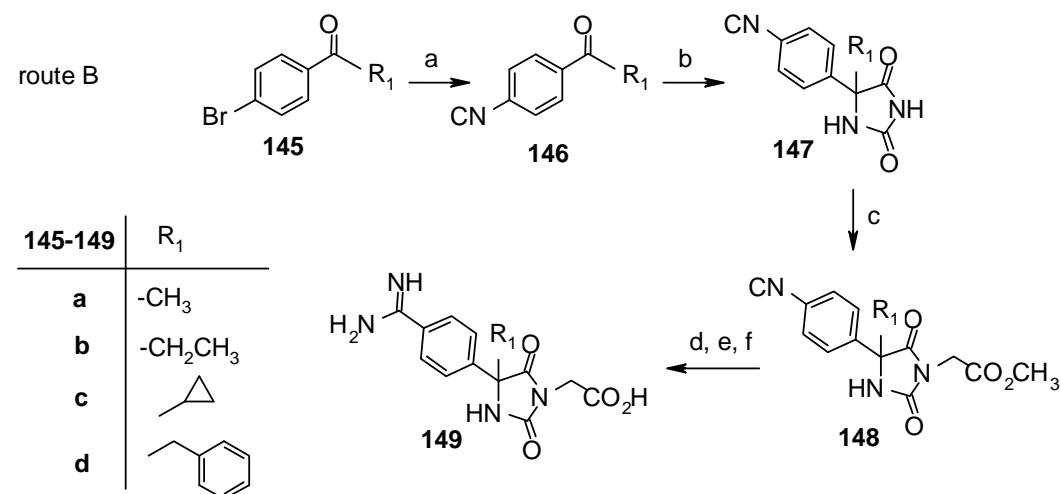

### 4.1 Compounds containing a benzamidine unit

Stilz *et al.* synthesized a series of active GP IIb/IIIa antagonists based on the hydantoin scaffold.<sup>13</sup>

Scheme 40. Preparation of the hydantoin scaffold.<sup>13</sup>

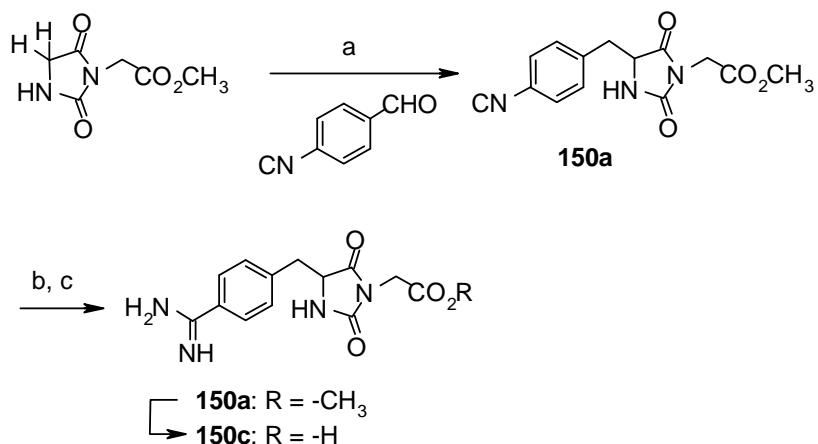

Amino acids (route A), ketones/aldehydes (route B) and unsubstituted hydantoins (route C) were used as precursors for the hydantoin scaffold (Scheme 37).<sup>13</sup>

(a) CuCN, DMF, reflux; (b) KCN,  $(NH_4)_2CO_3$ ; (c)  $Cl-CH_2CO_2CH_3$ , KI,  $NaOCH_3$ ; (d) HCl, ethanol; (e)  $NH_3$ , isopropanol; (f) HCl, reflux.

Scheme 41. Synthesis of compound 149.<sup>13</sup>

## route C

(a) CuCN, DMF, reflux; (b) KCN,  $(\text{NH}_4)_2\text{CO}_3$ ; (c)  $\text{Cl}-\text{CH}_2\text{CO}_2\text{CH}_3$ , KI, NaOCH<sub>3</sub>; (d) HCl, ethanol;  
(e) NH<sub>3</sub>, isopropanol; (f) HCl, reflux.

Scheme 42. Synthesis of compound **150c**.<sup>13</sup>

Table 11. Arginine replaced GP IIb/IIIa inhibitors.<sup>13</sup>

Comp	R <sub>1</sub>	R <sub>2</sub>	Comp	R <sub>1</sub>	R <sub>2</sub>
<b>151</b>		CH <sub>3</sub>	<b>155</b>		CH <sub>3</sub> CH <sub>2</sub>
<b>152'</b>		CH <sub>3</sub>	<b>156</b>		
<b>153'</b>	CH <sub>3</sub>		<b>157</b>		
<b>154</b>		H			

The suitability of benzamidine for substituting arginine is suggested by the 36-fold greater activity of compound **153** compared to the parent compound **179** (Scheme 44).<sup>13</sup>

Table 12. C-terminal variation of GP IIb/IIIa inhibitors.<sup>13</sup>

161	H		166	H	
162	H				

Compounds **158**, **160**, **161** and **162** showed good fibrinogen receptor binding activity.<sup>13</sup>

The ethyl ester prodrug **171** (Figure 18) is an orally active antithrombotic agent.<sup>13</sup>

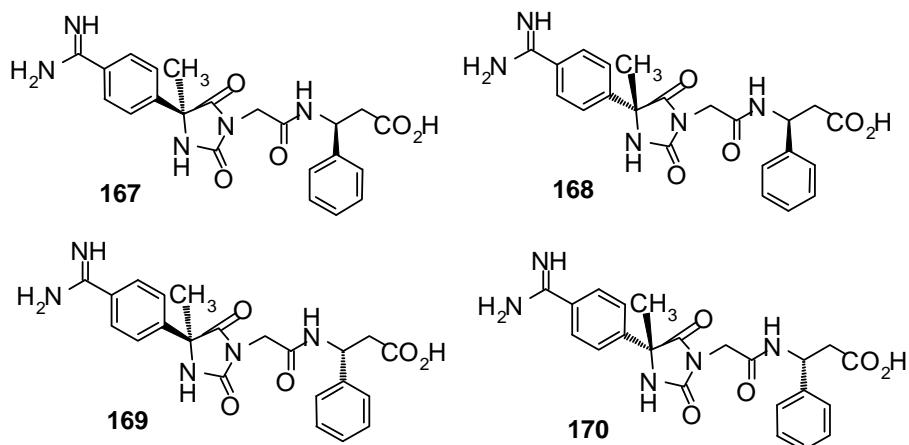

Figure 17. Stereoisomeres of **162**.<sup>13</sup>

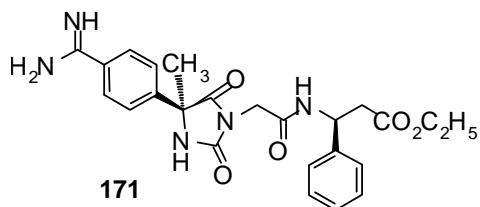

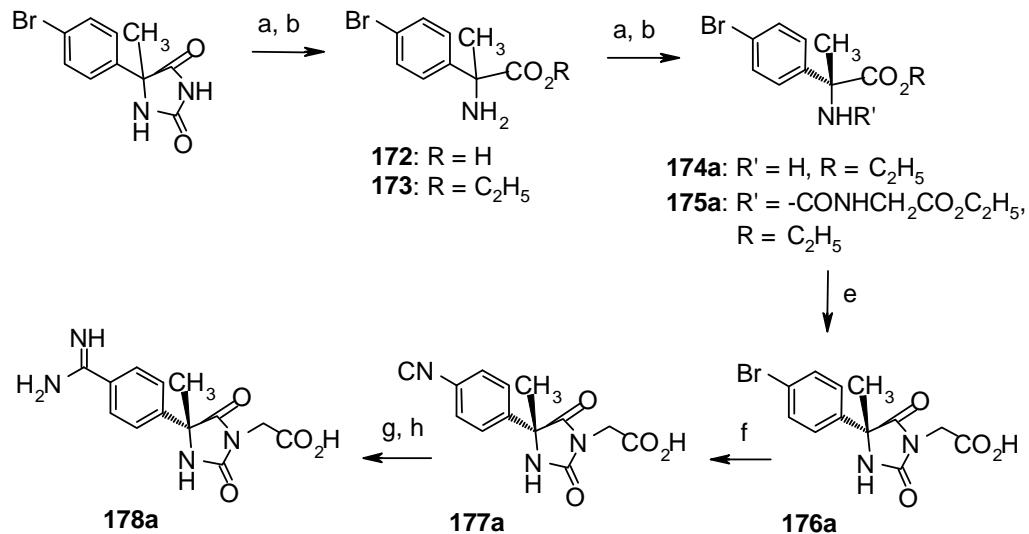

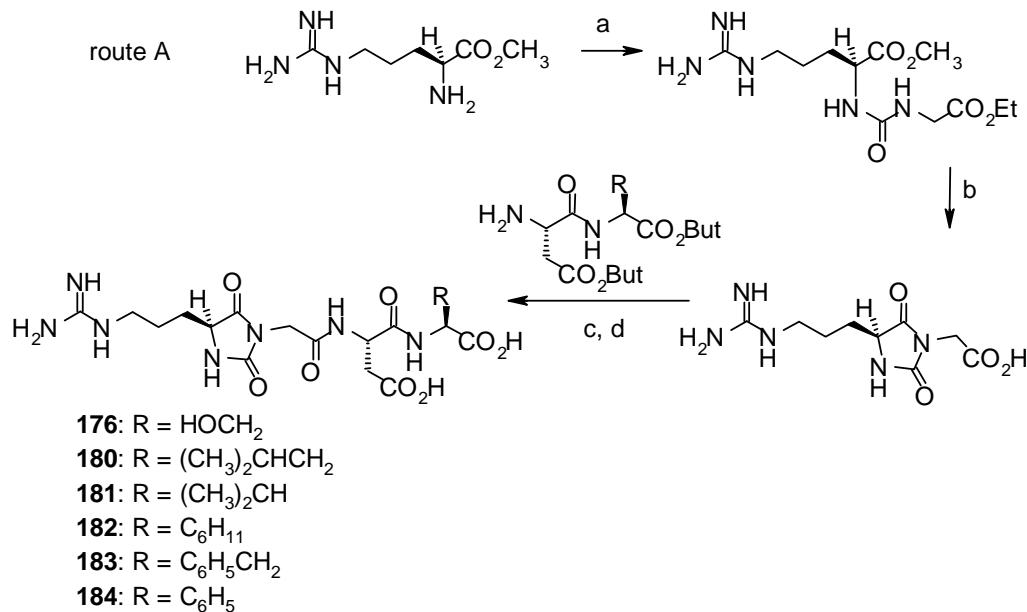

Figure 18. Maleic acid salt **171**.<sup>13</sup>

(a) NaOH, 145°C, 10 bar; (b) HCl, ethanol; (c) *R*-mandelic acid, isopropanol, diisopropyl ether; (d) ethoxycarbonylmethyl isocyanate, DMF, *N*-ethylmorpholine; (e) 6 N HCl; (f) CuCN, DMF; (g) HCl, ethanol; (h) NH<sub>3</sub>, ethanol.

Scheme 43. Synthesis of compound **178a**.<sup>13</sup>

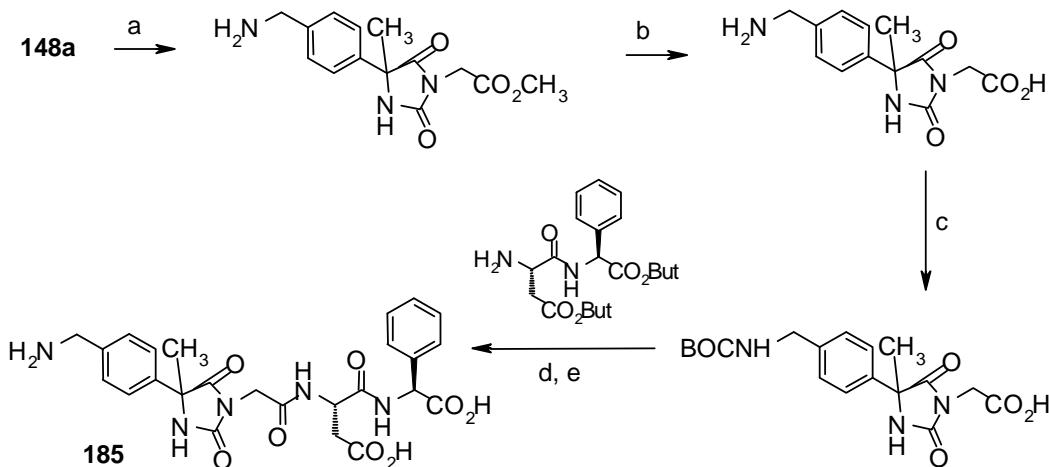

#### 4.2 Other hydantoin compounds

(a) Ethoxycarbonylmethyl isocyanate, *N*-ethylmorpholine, DMF, reflux; (c) DCC, HOBr, DMF; (d) TFA.

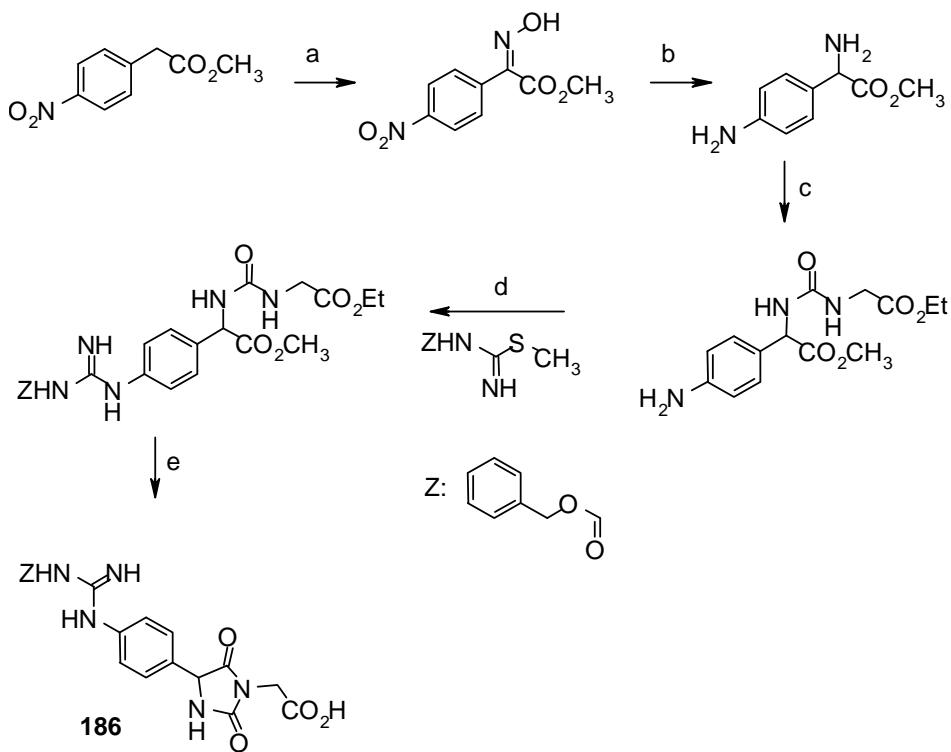

Scheme 44. Synthesis of compounds **179-184**.<sup>13</sup>

Compounds **181**, **182** and **184** exhibited greater potency than **179**, **180** and **183** showing that aliphatic or aromatic residues are favorable compared to the carboxy terminal serine.<sup>13</sup>

(a) Ethanol, acetic acid, 10% Pd/C, 2h, 3 bar; (b) conc. HCl, 100°C, 6 h; (c) dioxane, H<sub>2</sub>O, di-*tert*-butyl dicarbonate; (d) DCC, HOBr, DMF; (e) TFA, methanol, Pd/C, rt, 2h.

Scheme 45. Synthesis of compound **185**.<sup>13</sup>

(a) Isoamyl nitrite, methanol, NaOCH<sub>3</sub>; (b) HCl, methanol, DMF, 10% Pd/C, H<sub>2</sub>; (c) ethoxycarbonylmethyl isocyanate, *N*-ethylmorpholine, DMF, -20°C; (d) 1-benzyloxycarbonyl-2-methyl-isothiourea, CH<sub>3</sub>CO<sub>2</sub>H, methanol; (e) HCl, CH<sub>3</sub>CO<sub>2</sub>H, 80°C.

Scheme 46. Synthesis of compound **186**.<sup>13</sup>

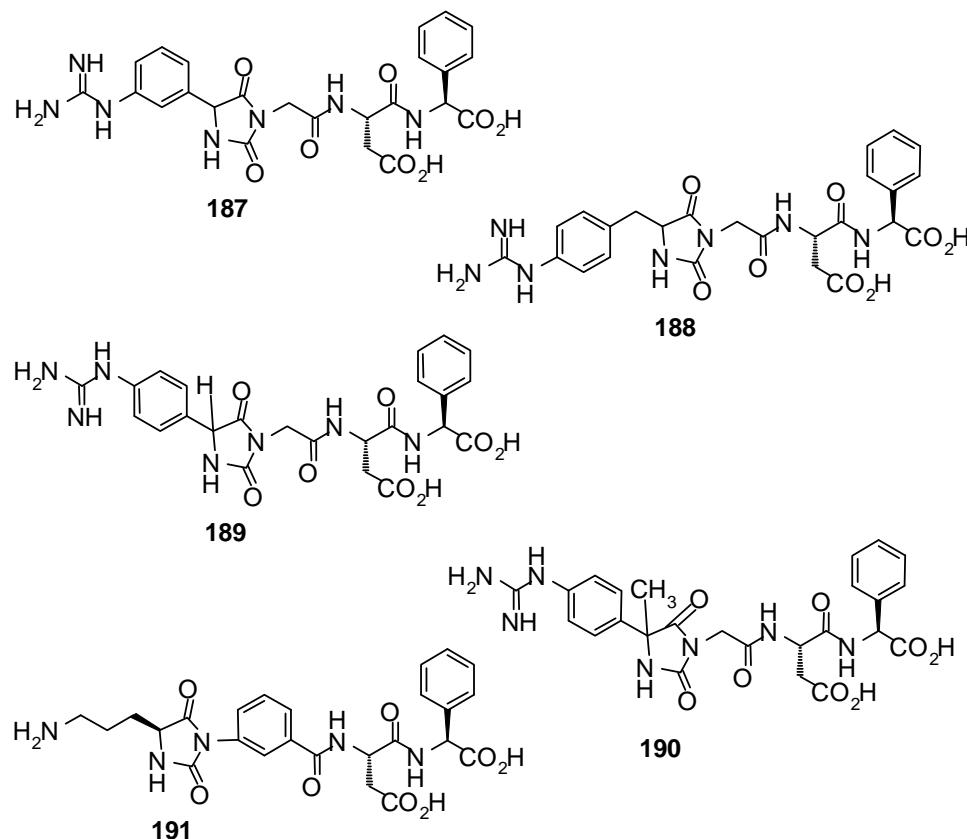

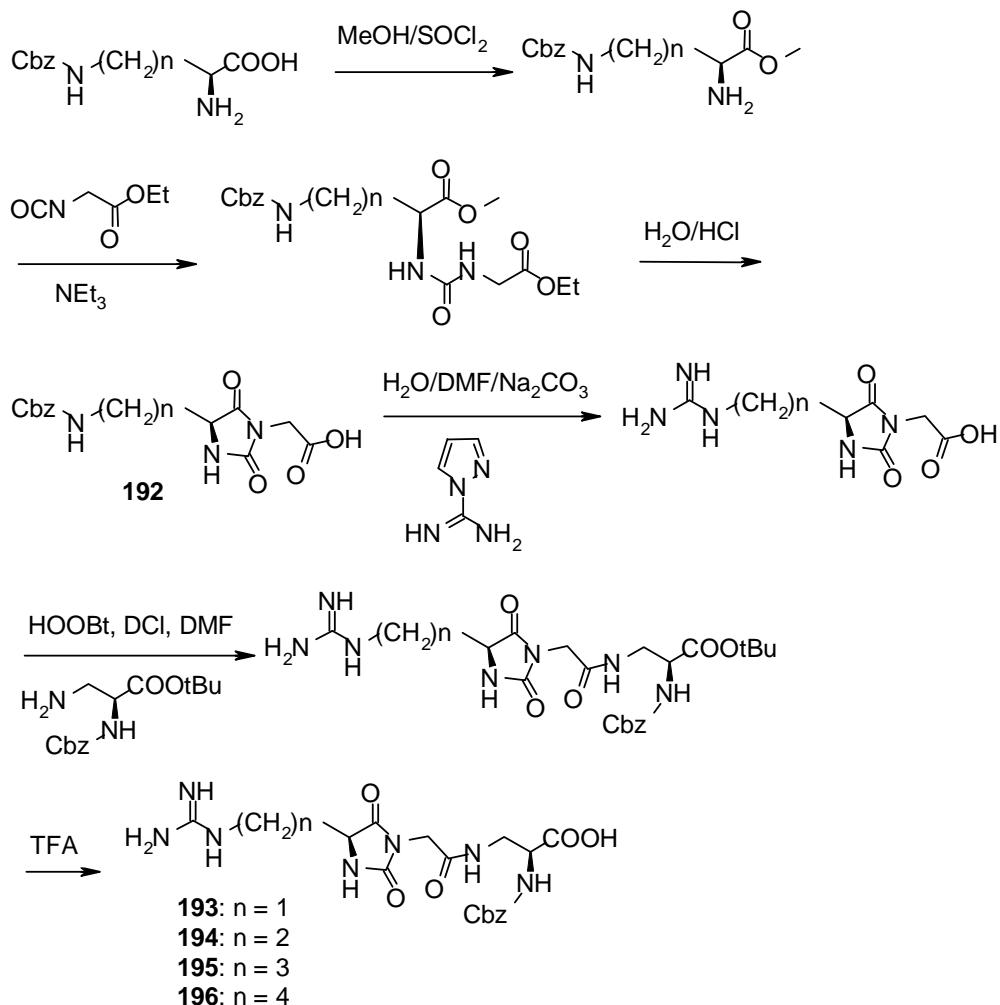

Figure 19. Arginine replaced GP IIb/IIIa inhibitors **187-191**.<sup>13</sup>

Compounds **185**, **189** and **190** showed much greater potency compared to compounds **187** and **188** which suggests that *p*-substitution of the rigid phenyl ring is favored over *m*-substitution and a more flexible phenylmethylene.<sup>13</sup>

Peyman *et al.* have designed a series of  $\alpha_v\beta_3$  antagonists containing a hydantoin scaffold.<sup>14</sup>

Scheme 47. Synthesis of integrin antagonists **193-196**.<sup>14</sup>

Compound **197** (Figure 20) is synthesized by treatment of **192** with 2-methylthio-2-imidazoline, and **198** (Figure 20) by reaction of **192** with 2-bromopyrimidine, followed in each case by the last two steps from Scheme 47.

Peyman *et al.* found compound **193** to have the optimal distance (12 bonds) between the C-terminal carboxyl group and the N-terminal guanidino group for an  $\alpha_v\beta_3$  antagonist whereas for  $\alpha_{IIb}\beta_3$  compound **194** with its 13 bonds showed higher affinity.<sup>14</sup> They also found cyclic guanidines to be preferred over non-cyclic guanidines as arginine mimetics for both  $\alpha_v\beta_3$  and  $\alpha_{IIb}\beta_3$  selectivity. When comparing the effect of the lipophilic side

chain Peyman *et al.* found compound **193** to clearly have the most favorable one (Cbz), compound **195** having the least favorable lipophilic side chain.<sup>14</sup>

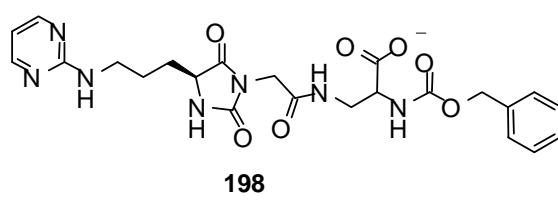

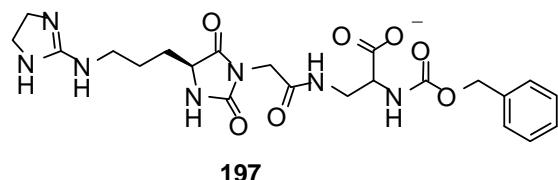

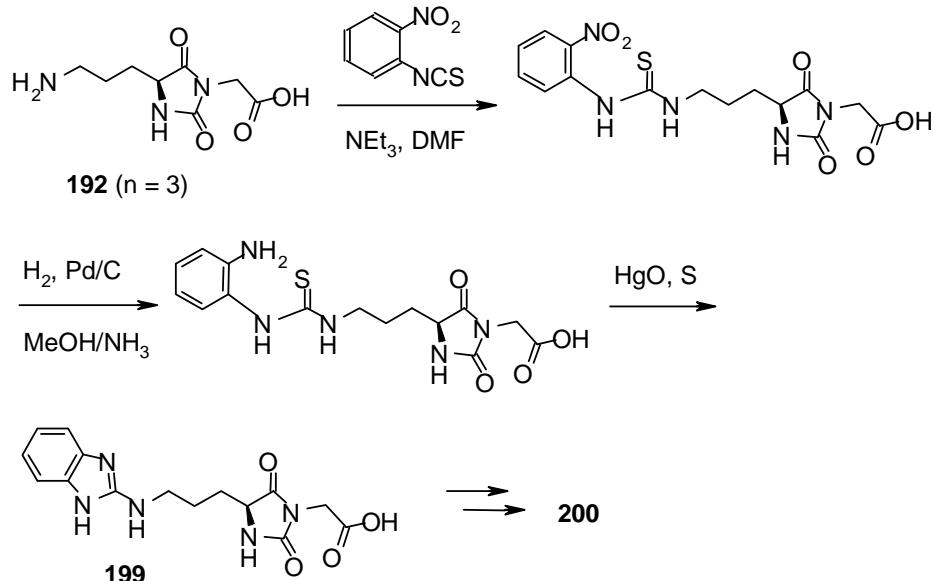

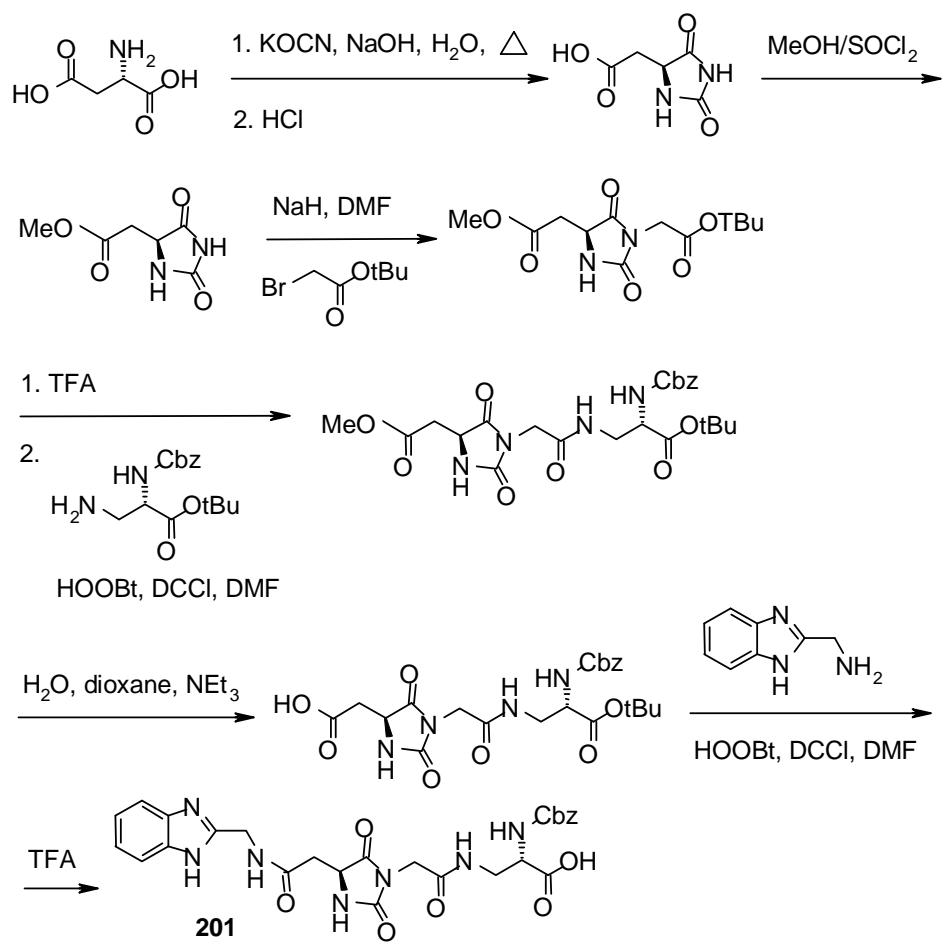

Figure 20. Integrin antagonists **197** and **198**.

Compound **199** is reacted further as in Scheme 36 to yield antagonist **200**.

Scheme 48. Synthesis of benzimidazole containing integrin antagonist **200**.<sup>14</sup>

Scheme 49. Synthesis of benzimidazole containing integrin antagonist **201**.<sup>14</sup>

Compound **202** (Figure 21) was prepared in a similar way to that depicted in Scheme 46 using (4,5-dihydro-imidazol-2-yl)-hydrazine instead of 2-aminomethyl-benzimidazole.<sup>14</sup>

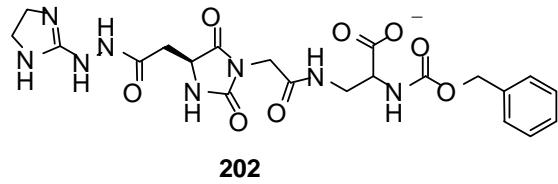

Figure 21. Integrin antagonist **202**.

Compounds **203-207** (Figure 22) were prepared by catalytic hydrogenation of **193** to remove the Cbz group and coupling of the appropriate side chain to the free amino function.<sup>14</sup>

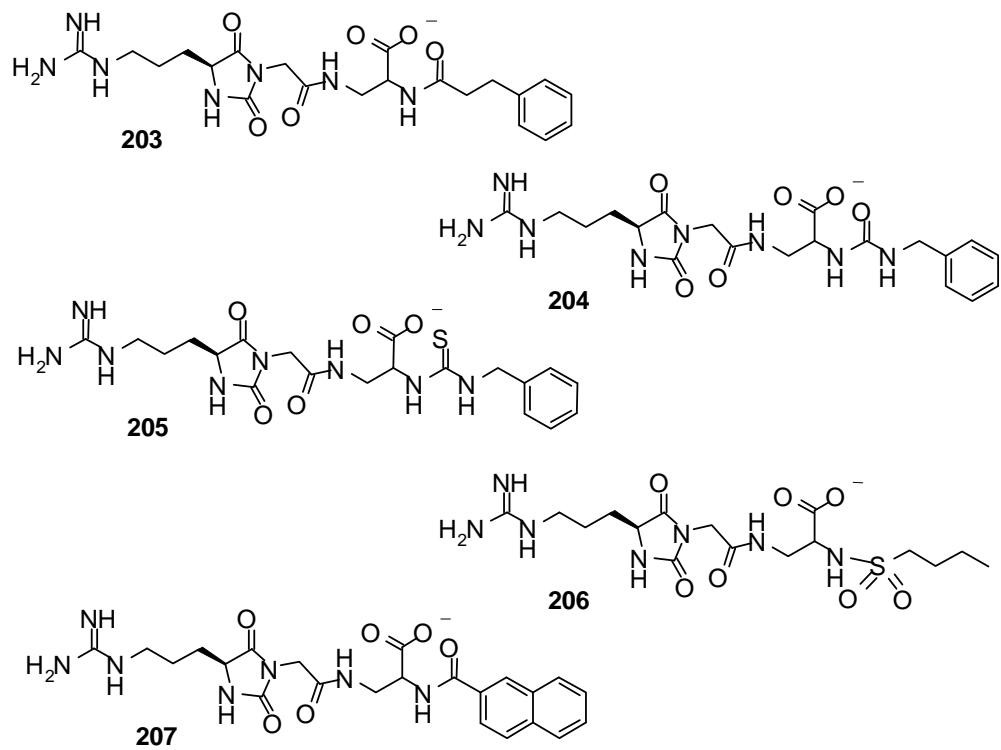

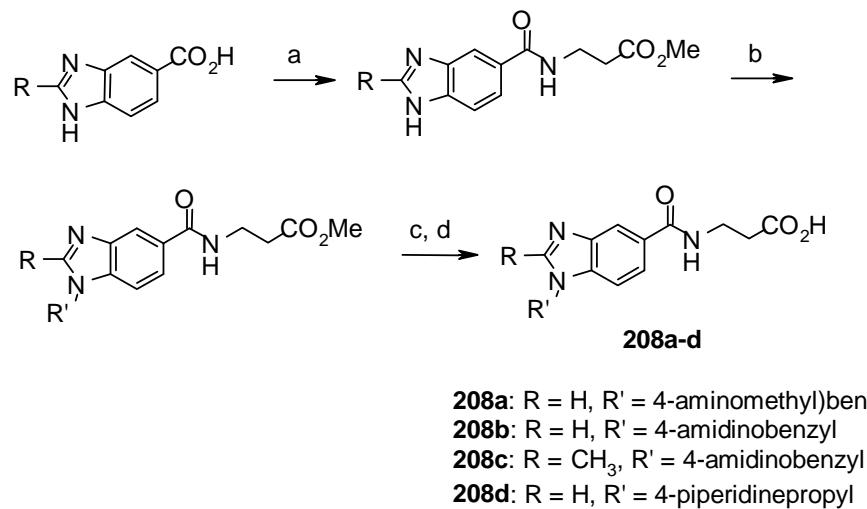

Figure 22. Integrin antagonists **203-207**.

## 5 Benzimidazole, benzoxazole and imidazopyridine compounds

### 5.1 Benzimidazole, benzoxazole and imidazopyridine compounds containing a benzamidine or *p*-cyanophenyl unit

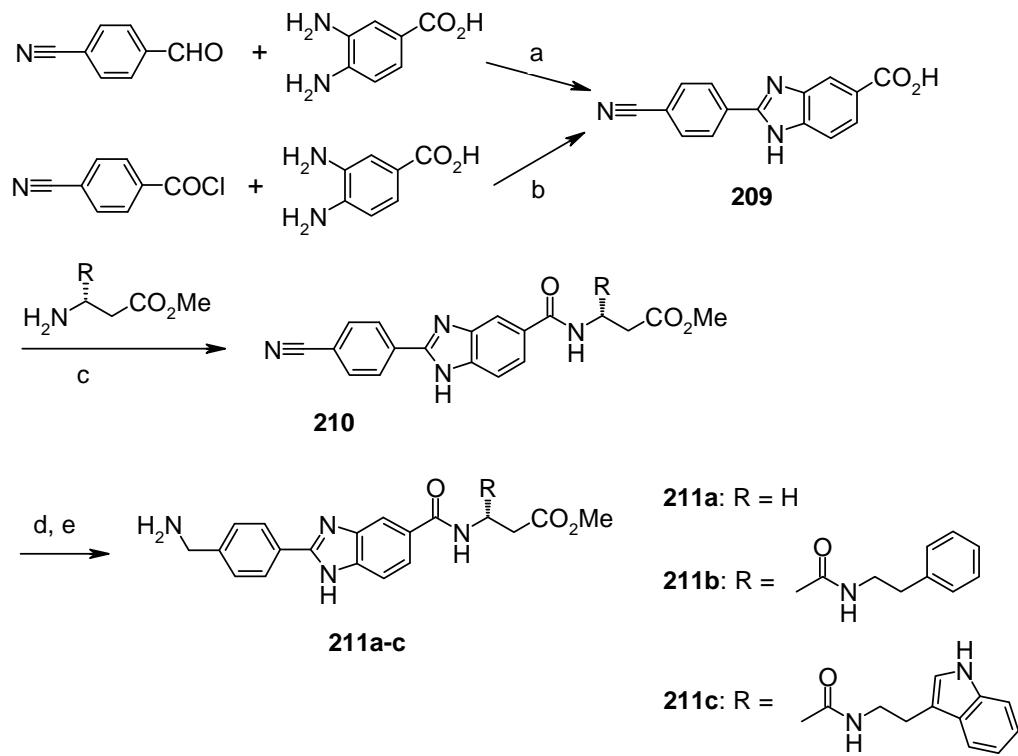

Xue *et al.* have designed a series of potent GP IIb/IIIa antagonists having a benzamidine as the basic moiety and an  $\alpha$ -carbamate or sulfonamide substituted  $\beta$ -alanine as the acidic moiety.<sup>15</sup>

(a)  $\beta$ -AlaOMe, TBTU, DIEA, DMF, 80-90%; (b) 4-cyanobenzyl bromide or N-Cbz-4-piperidinopropyl bromide, NaH, DMF, 40-60%; (c) H<sub>2</sub>, Pd/C, DMF, 80-90% (**208a** and **208d**) or (1) HCl, MeOH, (2) NH<sub>3</sub>, MeOH, 40-60% (**208b** and **208c**); (d) NaOH, MeOH, 80-90%.

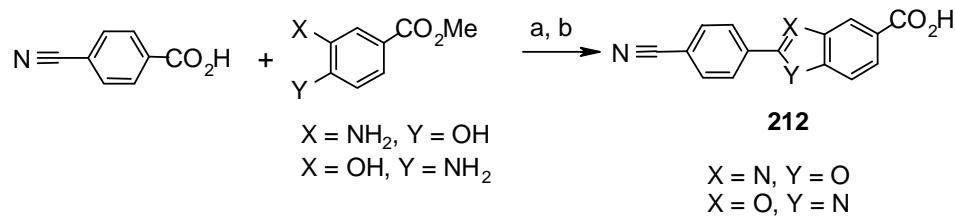

Scheme 50. Synthesis of compounds **208a-d**.<sup>15</sup>

Compound **208a** was found to be the least active of the four compounds in the inhibition of platelet aggregation showing that a benzamidine or a 4-piperidinopropyl group is preferred over a 4-aminomethylbenzyl group.

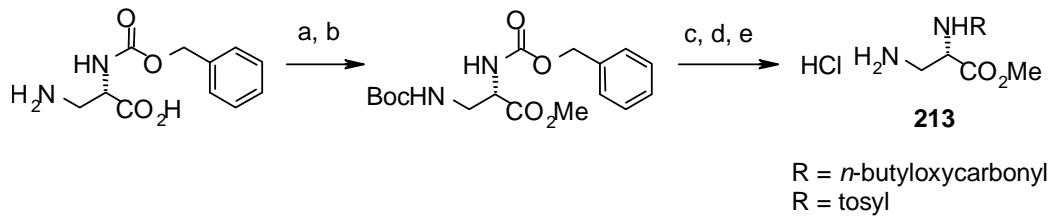

(a) (1) DMF, molecular sieves (2) CH<sub>3</sub>CO<sub>2</sub>H, reflux, 25%; (b) CH<sub>3</sub>CO<sub>2</sub>H, reflux, 30%; (c) TBTU, DIEA, DMF, 70-90%; (D) H<sub>2</sub>, Pd/C, DMF, HCl, 80-90%; (e) NaOH, MeOH, 80-90%.

Scheme 51. Synthesis of compounds **210** and **211a-c**.<sup>15</sup>

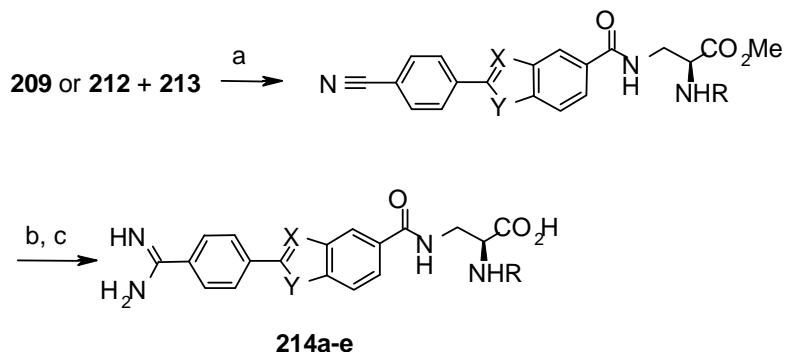

(a) Boric acid, xylene, reflux, 30-40%; (b) NaOH, MeOH, 80-90%.

Scheme 52. Synthesis of compounds **212**.<sup>15</sup>

(a) MeOH, 4 N HCl/dioxane, 90%; (b) (Boc)<sub>2</sub>O, DIEA, CHCl<sub>3</sub>, 85%; (C) H<sub>2</sub>, Pd/C, MeOH, 100%; (d) *n*-butyl chloroformate or *p*-toluenesulfonyl chloride, DIEA, CHCl<sub>3</sub>, 60-80%; (e) 4 N HCl/dioxane, 100%.

Scheme 53. Synthesis of compounds **213**.<sup>15</sup>

(a) TBTU, DIEA, DMF, 80-85%; (b) (1) HCl, MeOH (2) NH<sub>3</sub>, MeOH, 40-60%; (c) NaOH, MeOH, 80-90%.

Scheme 54. Synthesis of compounds **214a-e**.<sup>15</sup>

Compounds **214a-e** were found to be very potent GP IIb/IIIa inhibitors, **214a** being the least active.

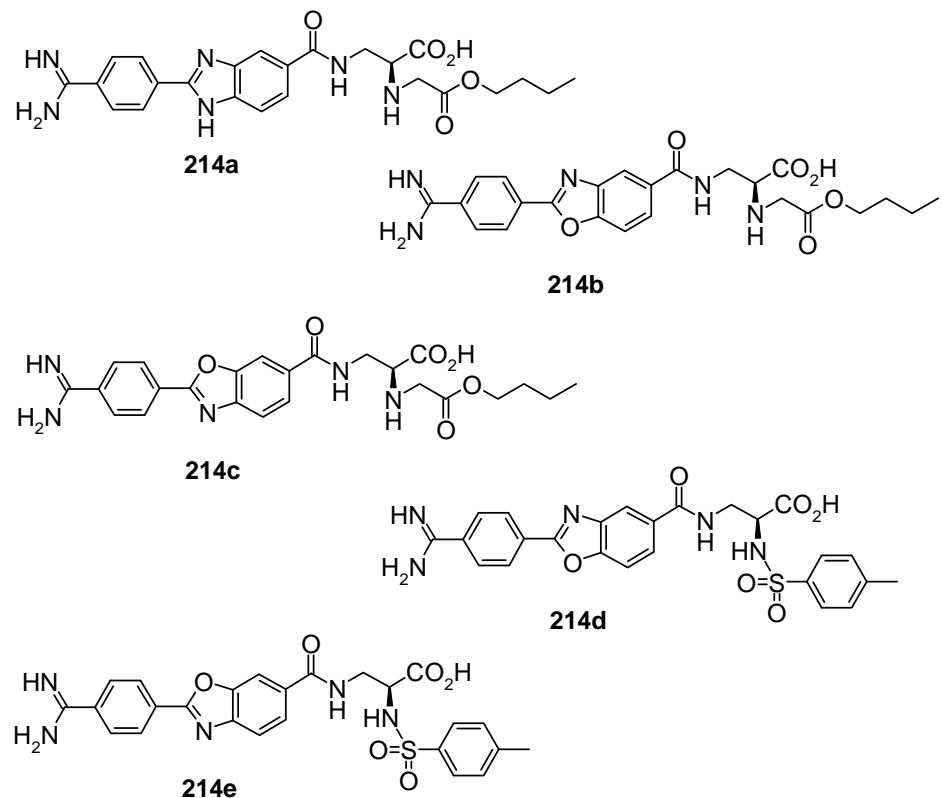

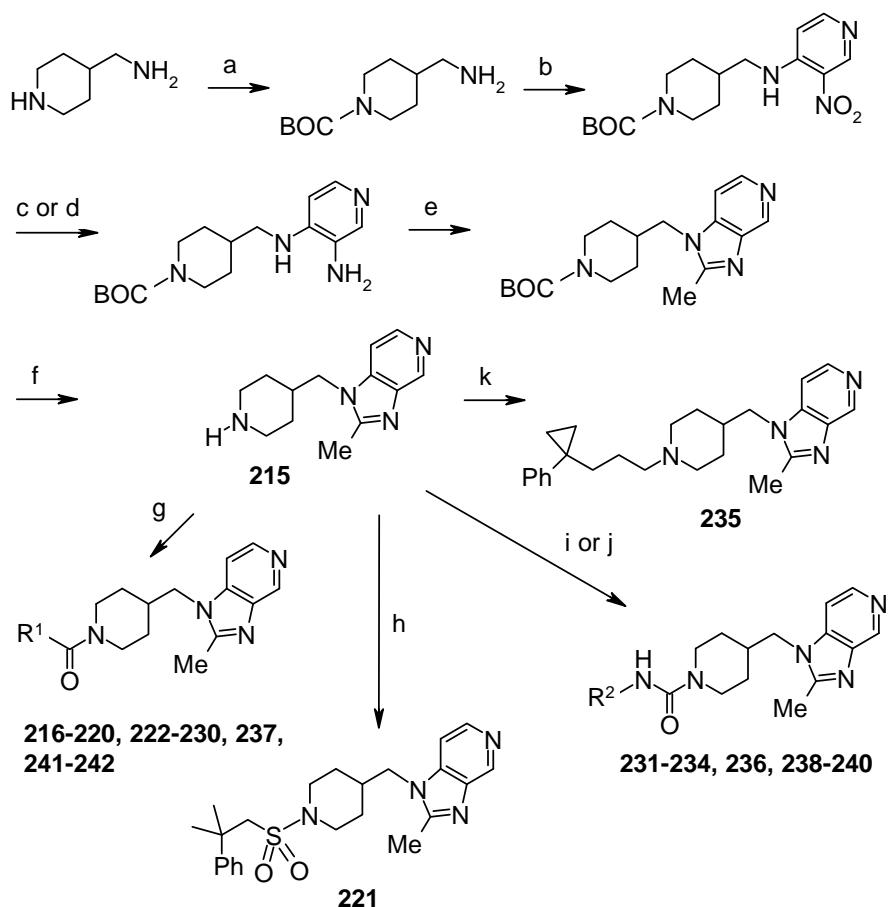

Figure 23. Benzimidazole/benzoxazole analogs **214a-e**.

## 5.2 Other benzimidazole, benzoxazole and imidazopyridine compounds

Carceller *et al.* have designed a series of 1-[(1-acyl-4-piperidyl)methyl]-1*H*-2-methylimidazo[4,5-*c*]pyridine derivatives as potent, orally active platelet-activating factor (PAF) antagonists.<sup>16</sup>

(a)  $\text{BOC}_2\text{O}$ ,  $\text{CHCl}_3$ , room temperature, 18 h; (b) 4-chloro-3-nitropyridine,  $\text{Et}_3\text{N}$ ,  $\text{CH}_3\text{Cl}$ , reflux for 18 h, 64% (two steps); (c)  $\text{H}_2$ , 10%  $\text{Pd/C}$ ,  $\text{MeOH}$ , 18 h; (d)  $\text{Na}_2\text{S}_2\text{O}_4$ , pyridine/ $\text{H}_2\text{O}$ , room temperature, 18 h; (e) ethyl acetimidate hydrochloride,  $\text{EtOH}$ , reflux, 18 h, 62% (two steps); (f) 6.5 N  $\text{HCl}_g$ /dioxane,  $\text{MeOH}$ , room temperature, 18 h, 78%; (g)  $\text{R}^1\text{COOH}$ , DCC, HOBT, DMF, room temperature, 18 h; (h)  $\text{Ph}(\text{CH}_3)_2\text{CCH}_2\text{SO}_2\text{Cl}$ ,  $\text{Et}_3\text{N}$ ,  $\text{CHCl}_3$ , room temperature, 18 h; (i)  $\text{R}^2\text{COOH}$ ,  $(\text{PhO})_3$ ,  $\text{Et}_3\text{N}$ , benzene, 90 °C, 2 h and then **215** was added, 90 °C, 18 h; (j)  $\text{R}^2\text{NHCOOPh}$ , pyr, 130 °C, 18 h; (k)  $\text{Ph}(\text{C}_3\text{H}_4)\text{CH}_2\text{OCOOPh}$ , pyr, 130 °C, 18 h.

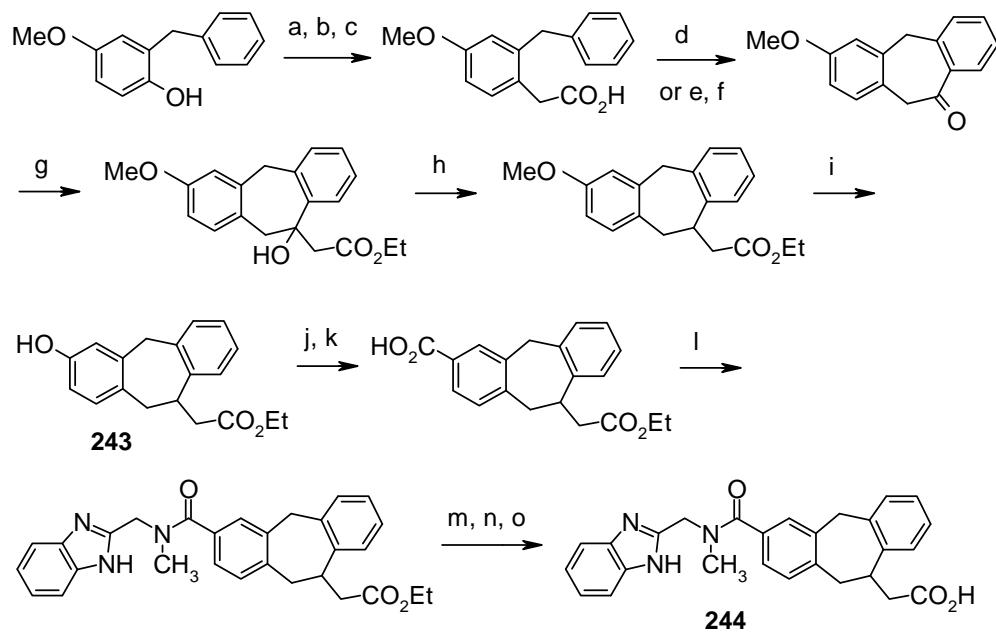

Scheme 55. Synthesis of imidazopyridines **216-242**.<sup>16</sup>

Table 13. Imidazopyridines **216-242**.<sup>16</sup>

Comp	R	Comp	R	Comp	R
<b>216</b>		<b>225</b>		<b>234</b>	
<b>217</b>		<b>226</b>		<b>235</b>	
<b>218</b>		<b>227</b>		<b>236</b>

<b>223</b>		<b>232</b>		<b>241</b>	
<b>224</b>		<b>233</b>		<b>242</b>	

According to Carceller *et al.* having three coordination centers is beneficial to this type of PAF antagonist: an  $sp^2$  nitrogen at a given distance from and orientation to an amide or other isosteric groups, and another coordination center such as a cyano group close to the  $sp^2$  nitrogen. Carceller *et al.* also found that branched substitution of the acyl moiety and a methoxy group at the 2-position of the aromatic ring increased activity. Compound **224** was found to be the most potent PAF antagonist.<sup>16</sup>

Miller *et al.* have synthesized potent vitronectin receptor antagonists.<sup>17</sup>

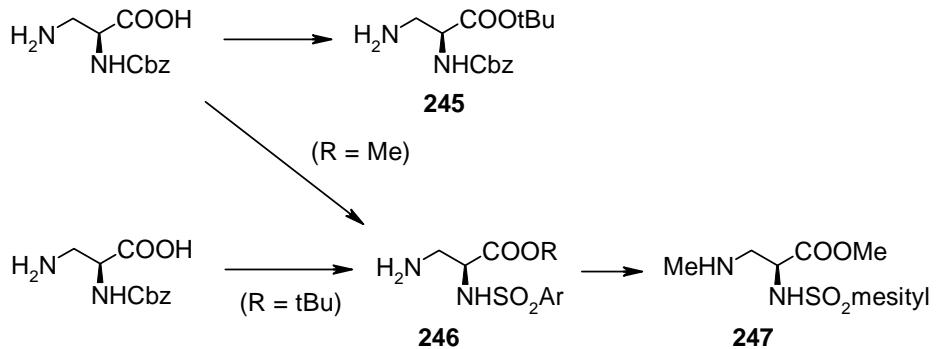

(a) Tf<sub>2</sub>O, 2,6-lutidine, CH<sub>2</sub>Cl<sub>2</sub>, -78 °C to RT (96%); (b) (allyl)SnBu<sub>3</sub>, LiCl, (Ph<sub>3</sub>P)<sub>2</sub>PdCl<sub>2</sub>, DMF, 95 °C (99%); (c) RuCl<sub>3</sub>, H<sub>5</sub>IO<sub>6</sub>, CH<sub>3</sub>CN, H<sub>2</sub>O, 0 °C to RT (74%); (d) PPA, 100-110 °C (48%); (e) (COCl)<sub>2</sub>, benzene, reflux; (f) AlCl<sub>3</sub>, CH<sub>2</sub>Cl<sub>2</sub>, 0 °C to RT (71%) for two steps; (g) EtOAc/LiHMDS, THF, -78 °C (73%); (h) H<sub>2</sub>, 10% Pd/C, conc HCl, AcOH (91%); (i) EtSH, AlCl<sub>3</sub>, CH<sub>2</sub>Cl<sub>2</sub>, 0 °C to RT (95%); (j) Tf<sub>2</sub>O, 2,6-lutidine, CH<sub>2</sub>Cl<sub>2</sub>, 0 °C to RT (92%); (k) CO, Pd(OAc)<sub>2</sub>, KOAc, dppf, DMSO, 70 °C (95%); (l) 2-(methylamino)methylbenzimidazole dihydrochloride, EDC, HOEt · H<sub>2</sub>O, (i-Pr)<sub>2</sub>NEt, DMF (95%); (m) 1.0 N LiOH, THF, H<sub>2</sub>O, 40°C; (n) 1.0 N HCl, H<sub>2</sub>O; (o) 5% NaHCO<sub>3</sub>, MeOH (45% for three steps).

Scheme 56. Synthesis of compound **244**.<sup>17</sup>

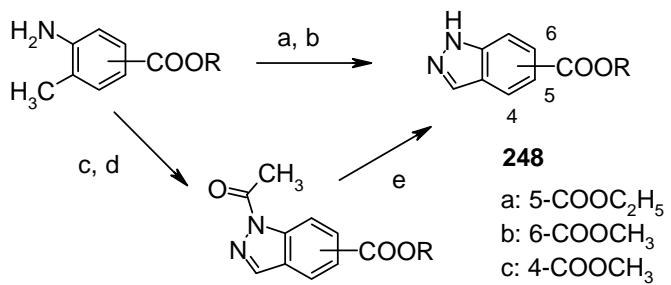

Compound **244** has good affinity for  $\alpha_v\beta_3$  and poor affinity for  $\alpha_{IIb}\beta_3$ . Significant improvement of activity was achieved with the similar ether-linked compound **647** (Scheme 133, chapter 11).<sup>17</sup>

## 6 Indazole compounds

Batt *et al.* have synthesized a series of indazole-containing  $\alpha_V\beta_3$  integrin antagonists.<sup>18</sup>

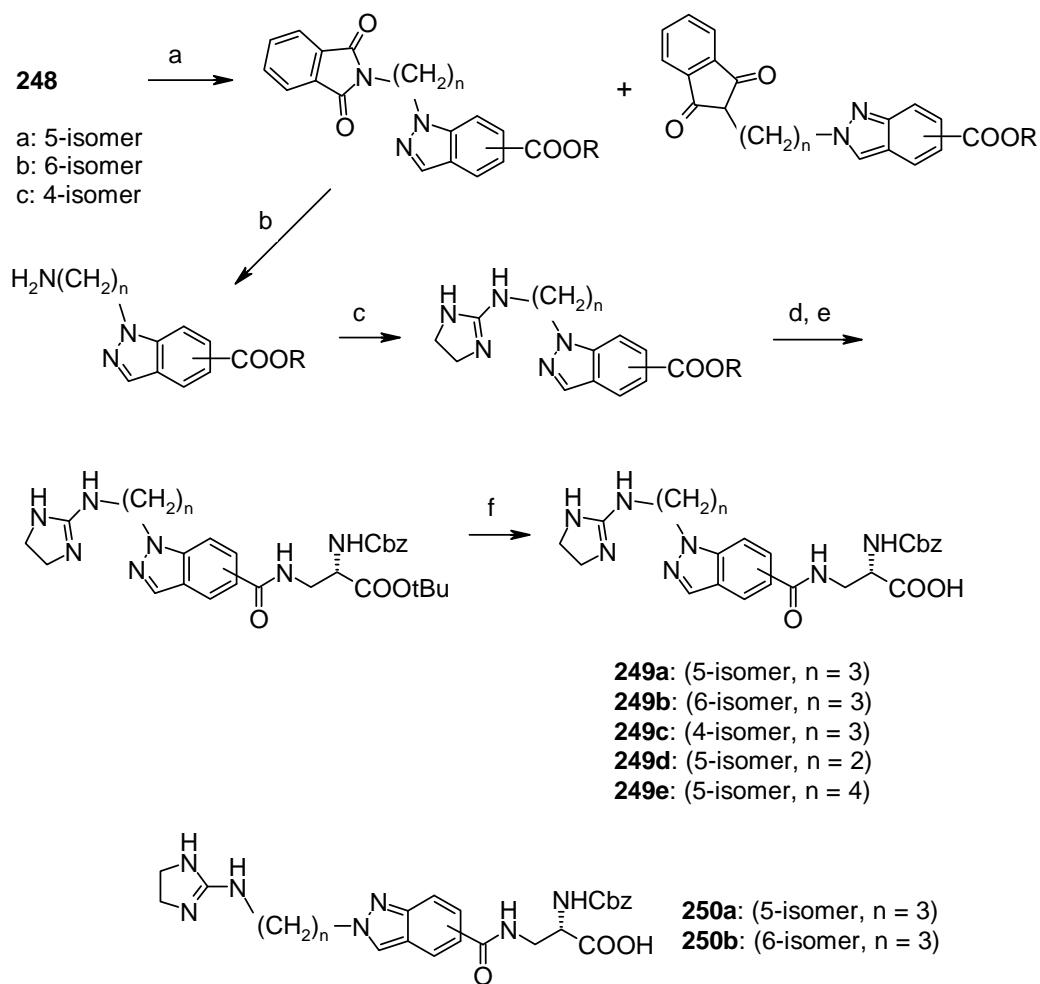

Scheme 53. Preparation of diaminopropionate derivatives.<sup>18</sup>

Scheme 60. Variation of the basic group late in the synthesis.<sup>18</sup>Scheme 61. Basic group introduction by reductive amination.<sup>18</sup>

Step g in Scheme 61 is as follows (compounds **262** are prepared from **261a**, compound **263** from **260b**):

For **262a** [from **246** (*R* = *tert*-butyl, Ar = mesityl)]: (1) MeOH, HOAc,  $\Delta$ , (2) CH<sub>2</sub>Cl<sub>2</sub>, TFA.

Compounds **262b-g**, **262p** and **262r-t** are prepared using the procedure for preparing **262a**:

For **262b**: from **246** (*R* = *tert*-butyl, Ar = mesityl),

**262c**: from **245**,

**262d**: from **246** (*R* = *tert*-butyl, Ar = mesityl),

**262e**: from *N*-mesitylenesulfonylethylenediamine trifluoroacetate,

**262f**: from  $\beta$ -alanine *tert*-butyl ester,

**262g**: from **246** (*R* = *tert*-butyl, Ar = phenyl),

**262p**: from **246** (*R* = methyl, Ar = 4-biphenyl),

**262r**: from **246** (*R* = methyl, Ar = 2,6-dichlorophenyl),

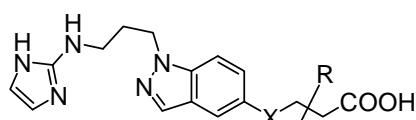

**262s**: from **246** (*R* = methyl, Ar = 2,6-dimethylphenyl),

**262t**: from **246** (*R* = *tert*-butyl, Ar = 4-phenyl-2,6-dimethylphenyl).

For **262u** [from **246** (*R* = methyl, Ar = 1-naphthyl)]: (1) EtOH, NaOH,  $\Delta$ , then HCl  
(2) TFA,  $\Delta$ .

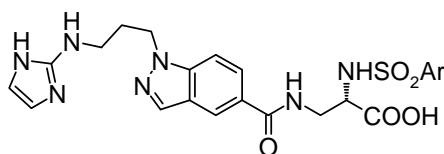

**263** [from **246** (*R* = *tert*-butyl, Ar = 2,4,6-trimethylphenyl)]: CH<sub>2</sub>Cl<sub>2</sub>, TFA.

Scheme 63. Variation of  $\alpha$ -substituent late in the synthesis.<sup>18</sup>

Step b in Scheme 63 is as follows (compounds **254** are prepared from **266a**, compounds **262** from **266b**):

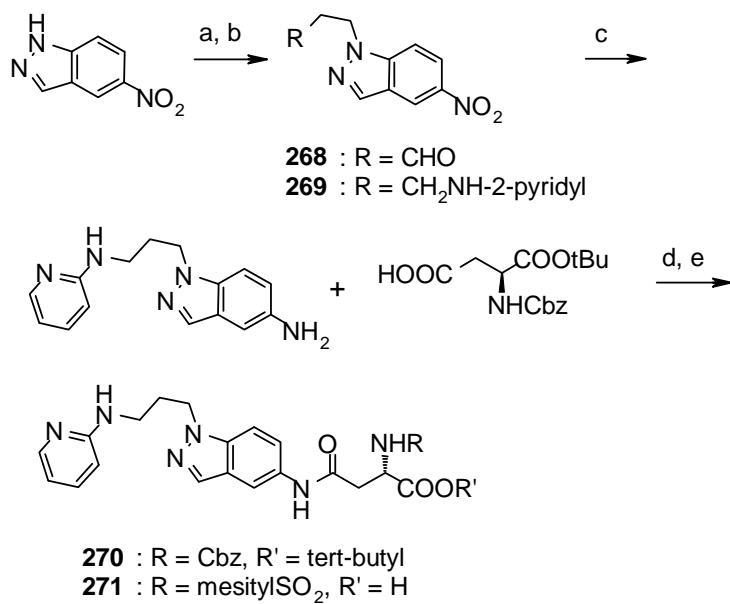

For **254g**: pyridine, 4-(dimethylamino)pyridine, DMF, isobutyl chloroformate,  
**254a**: pyridine, 4-(dimethylamino)pyridine, DMF, mesitylenesulfonyl chloride,  
**254h**: iPr<sub>2</sub>NEt, CH<sub>2</sub>Cl<sub>2</sub>, phenyl isocyanate,  
**254i**: iPr<sub>2</sub>NEt, CH<sub>2</sub>Cl<sub>2</sub>, benzyl isocyanate,  
**254j**: hydrocinnamic acid, DCC, HOBT, THF,  
**254k**: 4-methylvaleric acid, DCC, HOBT, THF.

The following compounds are prepared using the procedure for preparing **254g**:

**254m**: from benzenesulfonyl chloride,  
**254n**: from 1-butanesulfonyl chloride,  
**254p**: from phenylmethanesulfonyl chloride,  
**254q**: from 2-methylpropanesulfamyl chloride,  
**254r**: from phenylmethanesulfamyl chloride,  
**254s**: from benzenesulfamyl chloride,  
**254t**: from mesitylenesulfamyl chloride.

The following compounds are prepared from **266b** using the procedure for preparing **262h**:

- 262h:** pyridine, 4-(dimethylamino)pyridine, DMF, *p*-toluenesulfonyl chloride,
- 262i:** from 4-chlorobenzenesulfonyl chloride,
- 262j:** from 4-methoxybenzenesulfonyl chloride,
- 262k:** from 4-trifluoromethylbenzenesulfonyl chloride,
- 262m:** from 4-acetamidobenzenesulfonyl chloride,
- 262n:** from 4-*tert*-butylbenzenesulfonyl chloride,
- 262q:** from 3,4-dichlorobenzenesulfonyl chloride,
- 262v:** from 2-naphthalenesulfonyl chloride.

(a) See Scheme 57; (b) Fe, HOAc, 90 °C; (c) DCC, HOBT, DMF; (d) see Scheme 59.

Scheme 64. Preparation of retro-amide **271**.<sup>18</sup>

Basic groups 2-aminopyridine and 2-amino-imidazole increased the potency of the indazole series compared to 2-aminoimidazoline. Batt *et al.* found aryl sulfonamides to be the most potent exosite-binding groups with mesitylenesulfonamide analogue **262a** demonstrating excellent potency and nine-fold selectivity with respect to GPIIbIIIa.

## **7 Azatide and azacarba-peptide compounds**

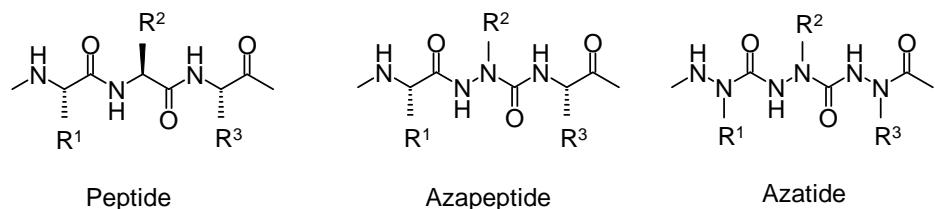

Figure 24. Comparison of a peptide, azapeptide and azatide.<sup>18</sup>

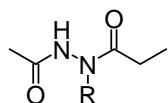

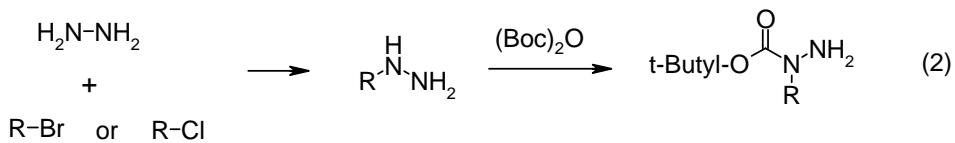

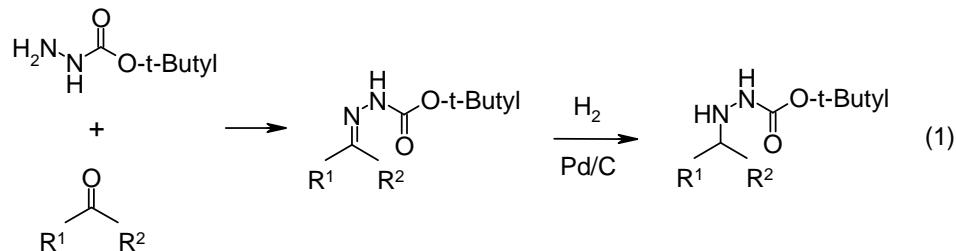

Figure 25. Azacarba-peptide.<sup>20</sup>

Han and Janda have developed an efficient method for the solution and liquid phase syntheses of an azatide oligomer consisting of monomeric  $\alpha$ -aza-amino acids.<sup>19</sup>

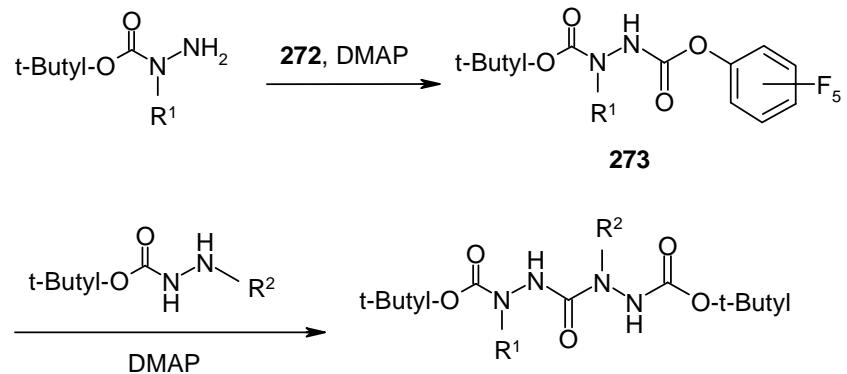

Scheme 65. Preparation of Boc-protected alkylhydrazine monomers.<sup>19</sup>

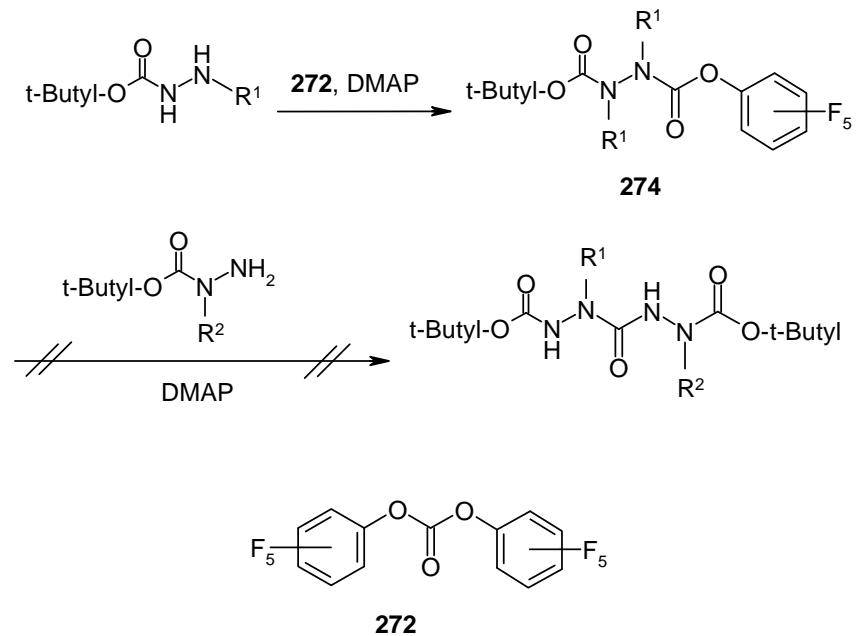

Reagents *p*-nitrophenyl chloroformate, carbonyldi-imidazole, bis(2,4-dinitrophenyl) carbonate, and trichloromethyl chloroformate were found to be unsuccessful in coupling two aza-amino acids together. Bis(pentafluorophenyl) carbonate **272** (Scheme 66) was chosen for the following reasons: the powerful electron-withdrawing ability of the

pentafluorophenol group, the minimizing of steric problems by the fluoro substituents, easy preparation and the easy-to-handle crystalline form.

1. Starting from 1-R<sup>1</sup>-hydrazine carboxylic acid, 1,1-dimethylethyl ester:

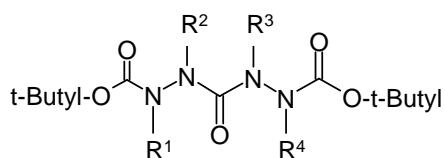

2. Starting from 2-R<sup>1</sup>-hydrazine carboxylic acid, 1,1-dimethylethyl ester:

Scheme 66. Routes for solution phase diazatide synthesis.<sup>19</sup>

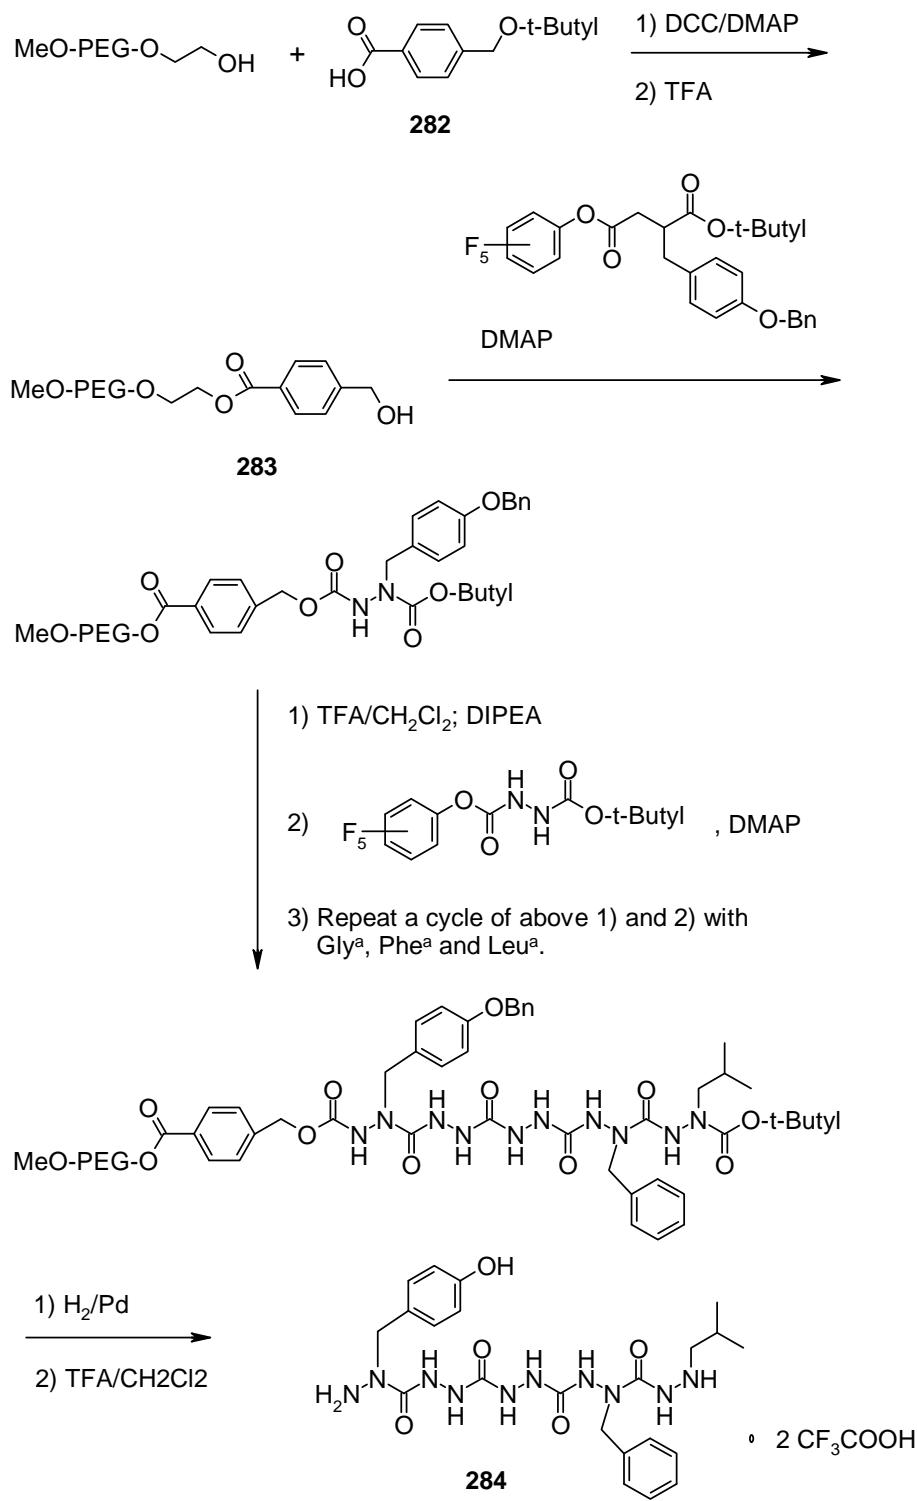

Coupling procedure 1 in Scheme 66 proved successful in producing a good yield of diazatides with few side reactions. Coupling procedure 2 was not successful.

Table 17. Preparation of diazatides starting from 1-R'-hydrazinecarboxylic acid, 1,1-dimethylethyl ester.<sup>19</sup>

Compd	R <sup>1</sup>	R <sup>2</sup>	R <sup>3</sup>	R <sup>4</sup>	yield (%)
<b>275</b>	H	H	H	H	92
<b>276</b>	methyl	H	H	methyl	91
<b>277</b>	H	methyl	H	methyl	90
<b>278</b>	H	methyl	H	benzyl	85
<b>279</b>	H	methyl	H	isobutyl	84
<b>280</b>	H	isobutyl	H	isobutyl	82
<b>281</b>	H	isopropyl	H	isopropyl	84

Han and Janda also used polymer-supported liquid phase synthesis to prepare a small well-defined  $\alpha$ -azatide with poly(ethylene glycol) monomethyl ether (MeO-PEG) functioning as a terminal-protecting group for the product (Scheme 67). Methyl *p*-(hydroxymethyl)benzoate was *O*-protected as the *tert*-butyl ether by treatment with isobutylene and acid.<sup>19</sup> The methyl ester was then hydrolyzed by lithium oxide providing **282** (Scheme 67).

Scheme 67. MeO-PEG supported Leu-enkephalin azatide synthesis.<sup>19</sup>

Sulyok *et al.* have synthesized a low molecular weight RGD mimetic library, including highly active and selective nonpeptide  $\alpha_v\beta_3$  integrin antagonists based on lead

compound **285** (Figure 26).<sup>19</sup> Compound **285** has good affinity and selectivity toward the  $\alpha_v\beta_3$  integrin receptor ( $IC_{50}$ : 150 nM), but Sulyok *et al.* aimed at preparing a compound with greater lipophilicity in order to enhance the medical prospects of the product in comparison to compound **285**.

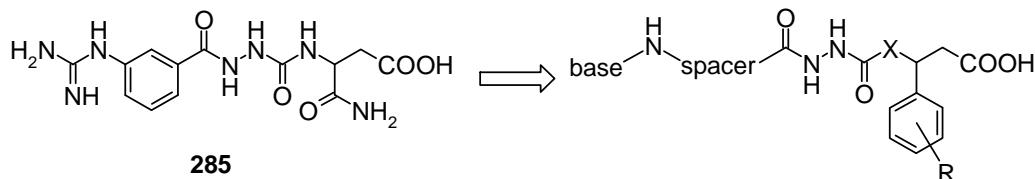

Figure 26. Aza-RGD mimetics with various aromatic  $\alpha$ -amino acids ( $X = \text{NH}$ ) or glutaric acids ( $X = \text{CH}_2$ ) and different guanidine mimetics derived from compound **285**.<sup>20</sup>

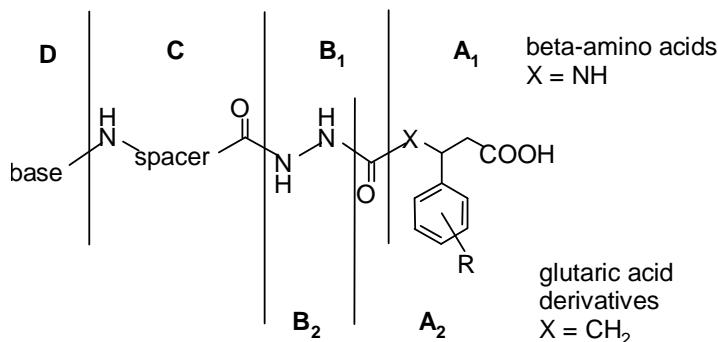

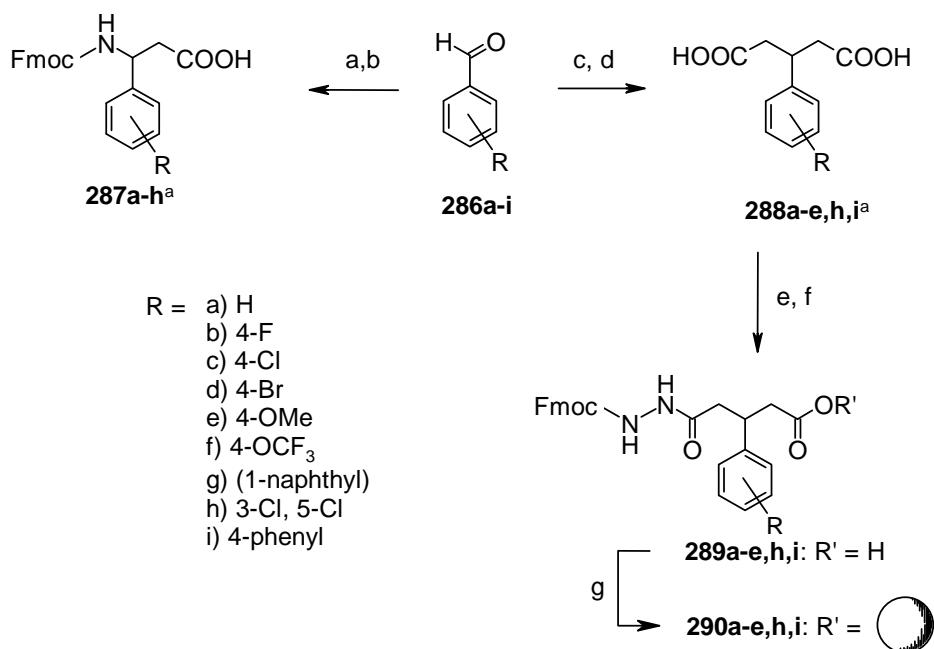

Figure 27. Retrosynthetic analysis of the RGD mimetic library obtaining four different building blocks: carboxylic acid **A**<sub>1</sub> ( $\alpha$ -amino acids) and **A**<sub>2</sub> (glutaric acids), **B**<sub>1</sub> (aza-glycine) and **B**<sub>2</sub> (hydrazine), spacer **C**, and basic building block **D**.<sup>20</sup>

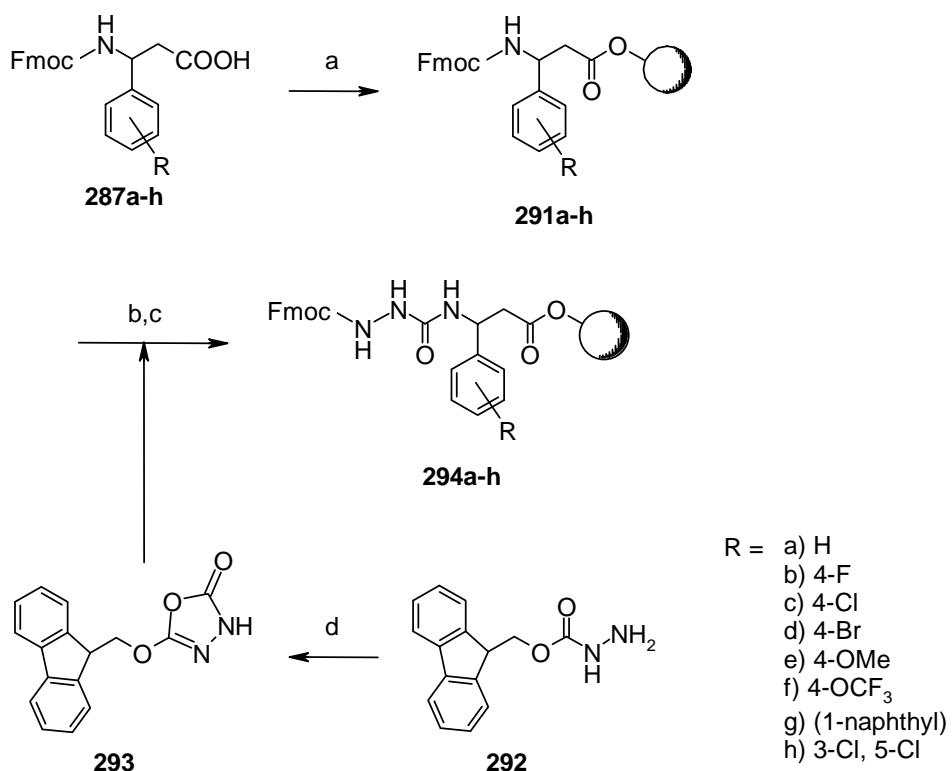

An aromatic (3-aminobenzoic acid) and an aliphatic (5-aminopentanoic acid) spacer were used as building block **C**. Guanidine was used as building block **D** and so were the more lipophilic methylamidine and 2-aminopyridine. Guanidine and methylamidine were used in connection with an aromatic spacer, and aminopyridine with an aliphatic spacer.<sup>20</sup>

Reagents: (a) NH<sub>4</sub>OAc, malonic acid, EtOH (74-88%); (b) Fmoc-Cl, NaHCO<sub>3</sub>, dioxane (76-98%); (c) ethyl acetoacetate, piperidine (cat.) (42-85%); (d) 20 M KOH, 85°C (68-99%); (e) acetic anhydride (62-89%); (f) N-Fmoc-hydrazine, THF (100%); (g) TCP resin, DIEA, CH<sub>2</sub>Cl<sub>2</sub>.

<sup>a</sup> Compounds **287d**, **287g** and **288a** were purchased from commercially available sources.

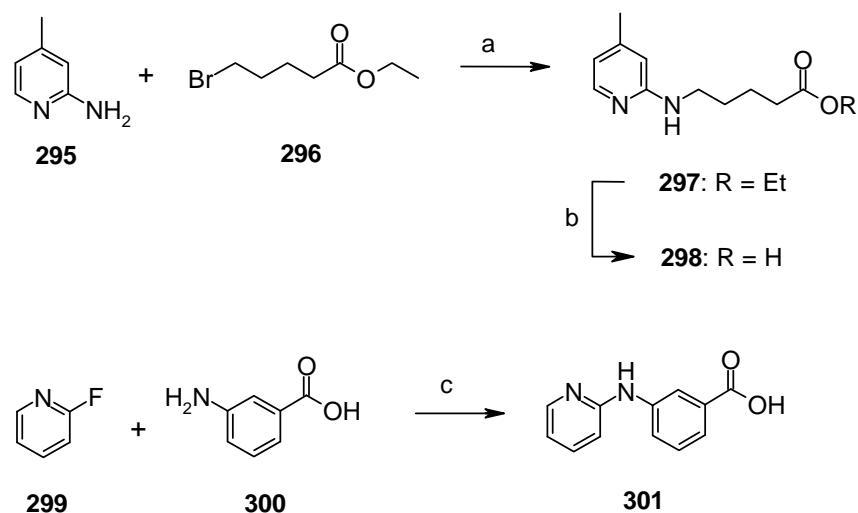

Scheme 68.<sup>20</sup> Synthesis of building blocks A<sub>2</sub>.

Reagents: (a) TCP resin, DIEA, CH<sub>2</sub>Cl<sub>2</sub>; (b) 20% piperidine/DMF; (c) 5-(9*H*-fluoren-9-ylmethoxy)-1,3,4-oxadiazol-2(3*H*)-one (**293**); (d) phosgene (1.9 M solution in toluene), sat. NaHCO<sub>3</sub>, CH<sub>2</sub>Cl<sub>2</sub> (85%).

Scheme 69.<sup>20</sup> Synthesis of the resin-bound Fmoc-protected aza-Gly- $\beta$ -amino acid derivatives **294a-h** (building blocks A<sub>1</sub>B<sub>1</sub>).

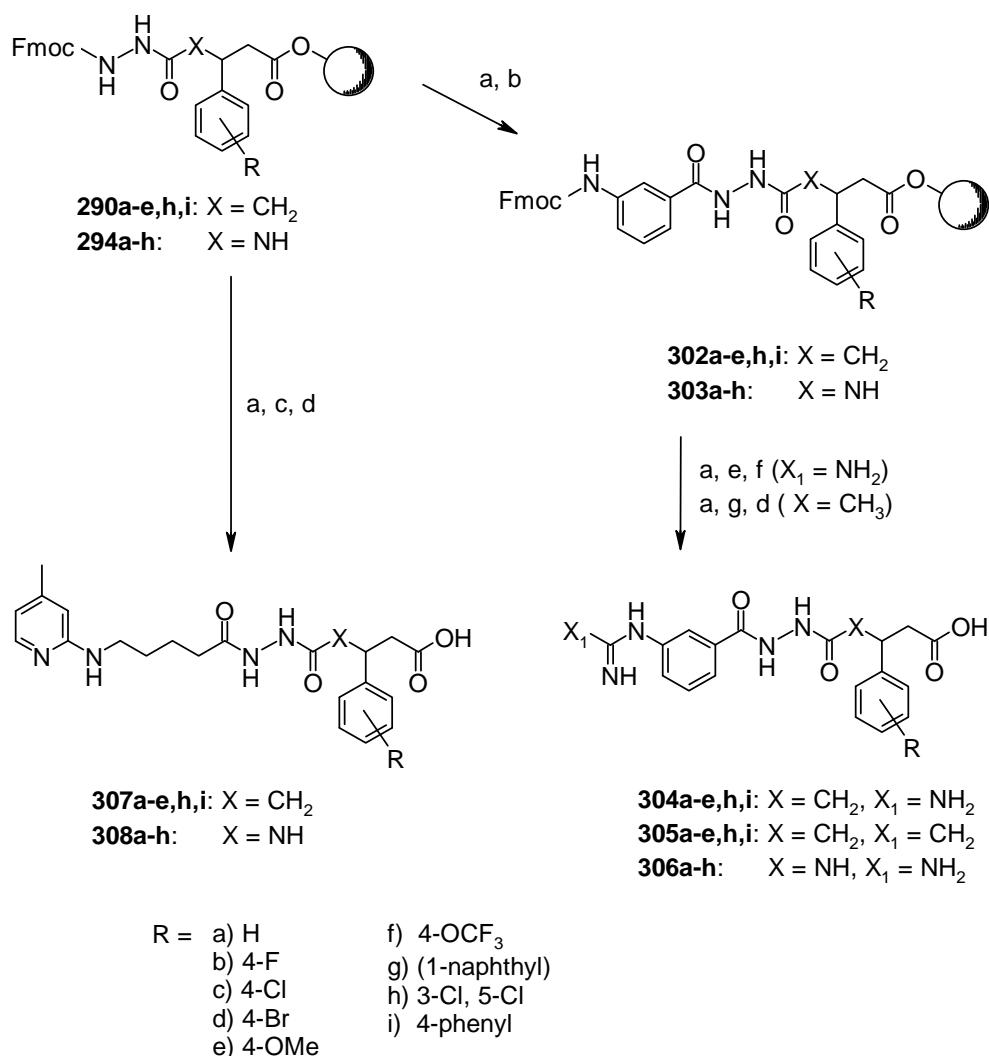

Next is the coupling of building blocks C and D. 2-Aminopyridine was linked to the spacer molecule C in solution (Scheme 70), whereas guanidine or amidine are coupled on solid support.<sup>20</sup>

Reagents: (a) 100°C (23%); (b) 1 N NaOH (64%); (c) NaH, DMF, 80°C (10%).

Scheme 70.<sup>20</sup> Synthesis of building blocks CD **298** [5-(4-methylpyridine-2-yl)aminopentanoic acid] and **301**.

After removing the Fmoc-protection from aza-compounds **290a-e,h,i** ( $X = \text{CH}_2$ ) and **294a-h** ( $X = \text{NH}$ ) with piperidine, building blocks C and CD were coupled under standard solid-phase coupling conditions (Scheme 71).<sup>20</sup>

Reagents: (a) 20% piperidine/DMF; (b) 3-(N-Fmoc-amino)benzoic acid, HATU, collidine, DMF; (c) 5-(4-methylpyridine-2-yl)aminopentanoic acid (**298**), HATU, collidine, DMF; (d) AcOH/TFE/CH<sub>2</sub>Cl<sub>2</sub> (1:1:3); (E) N,N'-bis-Boc-1-guanolpyrazole, CHCl<sub>3</sub>, 50°C; (f) 95% TFA/ 5% TIPS; (g) S-2-naphthyl-methyl thioacetimidate hydrobromide, DIEA, NMP.

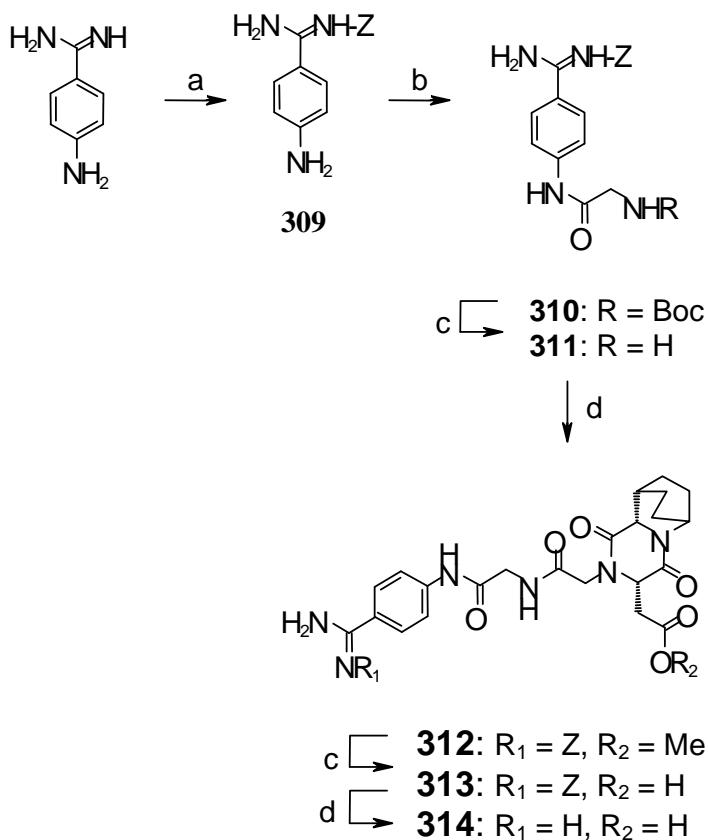

Scheme 71.<sup>20</sup> Synthesis of aza-RGD mimetics.

All compounds synthesized by Sulyok *et al.* show little or no activities to  $\alpha_{IIb}\beta_3$  ( $IC_{50} > 10,000$  nM) with many showing good affinity to  $\alpha_v\beta_3$ , hence constructing a library of highly active and selective RGD mimetics.<sup>20</sup>

## 8 Benzamidine compounds

### 8.1 Benzamidine compounds containing a piperazine unit

Pons *et al.* have synthesized a 2,5-diketopiperazine peptidomimetic (**314**, Scheme 69) which shows selective platelet-aggregation activity. Compound **314** shows selectivity towards inhibiting the binding of fibrinogen to its receptor GPIIb/IIIa. This selectivity may be caused by the benzamidine group and the rigidity brought on by the diketopiperazine group.<sup>20</sup>

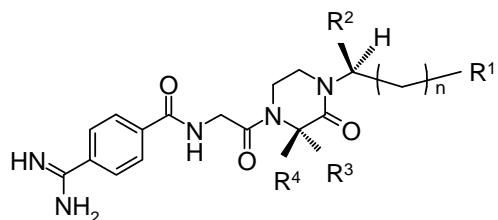

(a) ZCl, NaOH, THF, H<sub>2</sub>O (50%); (b) (Boc Gly)<sub>2</sub>O, DMAP, dichloromethane (42%); (c) TFA, dichloromethane (74%); (d) DCC, DMAP, dichloromethane (31%); (e) NaOH, dioxane, H<sub>2</sub>O (73%); (f) H<sub>2</sub>/Pd(OH)<sub>2</sub>/C, EtOH (49%).

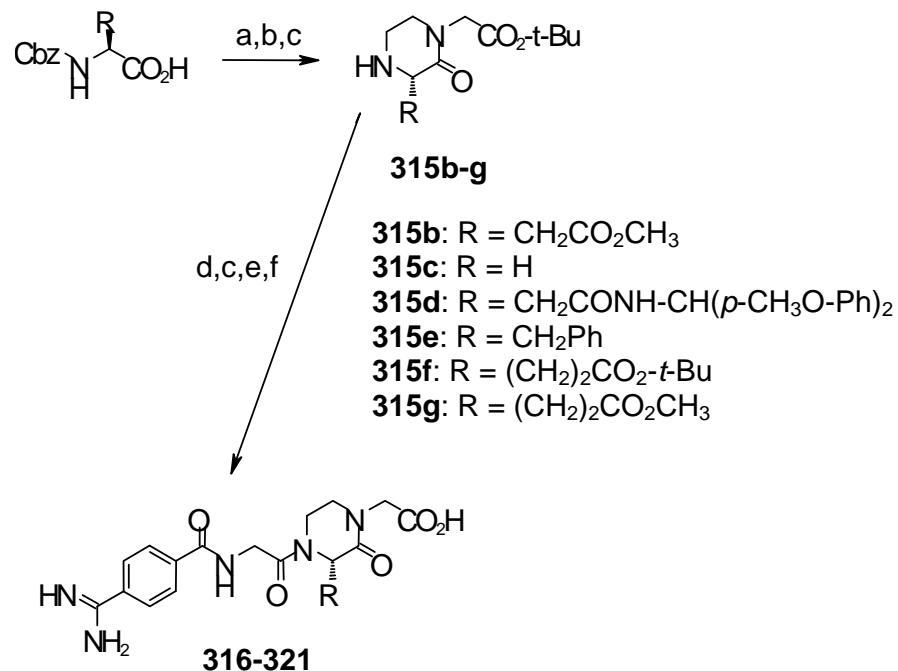

Scheme 72.<sup>21</sup> Synthesis of compound **314**.

Sugihara *et al.* have synthesized several benzamidine compounds containing a 2-oxpiperazine unit, one of which is a potent and orally active GPIIb/IIIa antagonist (**316**, Table 18). See also compounds **415d** and **415h** in 9.1, Table 23.<sup>21</sup>

Table 18. The substituents of compounds **316-326**.<sup>22</sup>

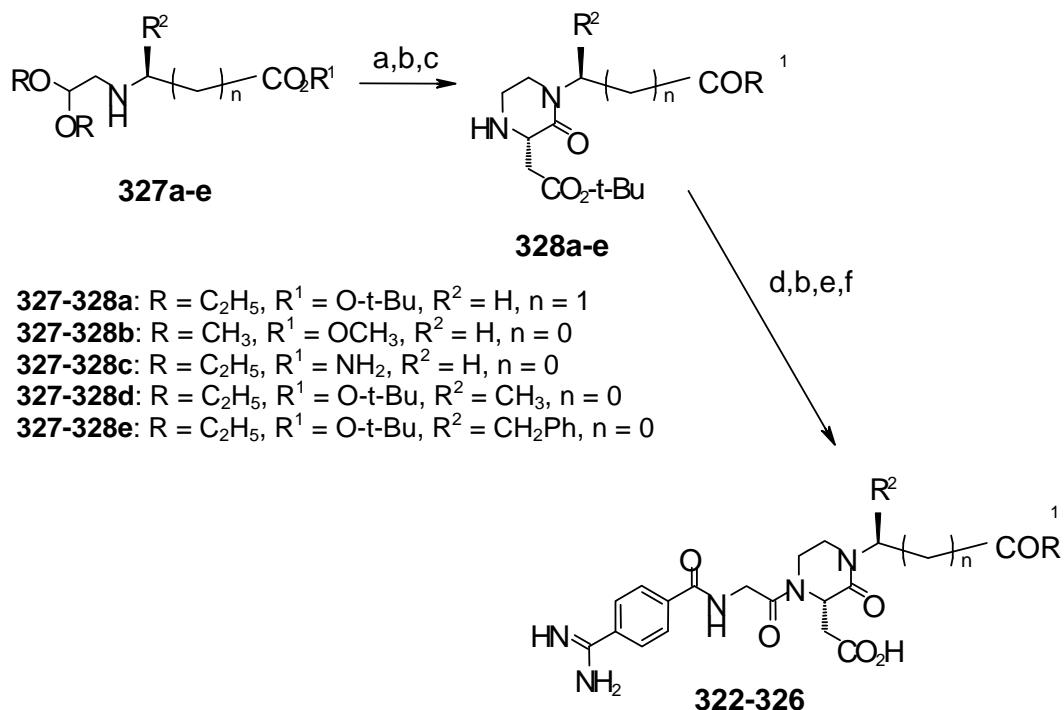

Compound	R <sup>1</sup>	R <sub>2</sub>	R <sup>3</sup>	R <sup>4</sup>	n

<b>341</b>	H	HO <sub>2</sub> C-(CH <sub>2</sub> ) <sub>3</sub> -O-	-	-

Compound **339** showed ten times less potency than **338** caused by the substitution of the carboxymethyleneneoxy group by a carboxyethyl group, and substitution by the carboxysisopropylideneoxy group in **340** caused a 1000-fold decrease in activity.<sup>23</sup>

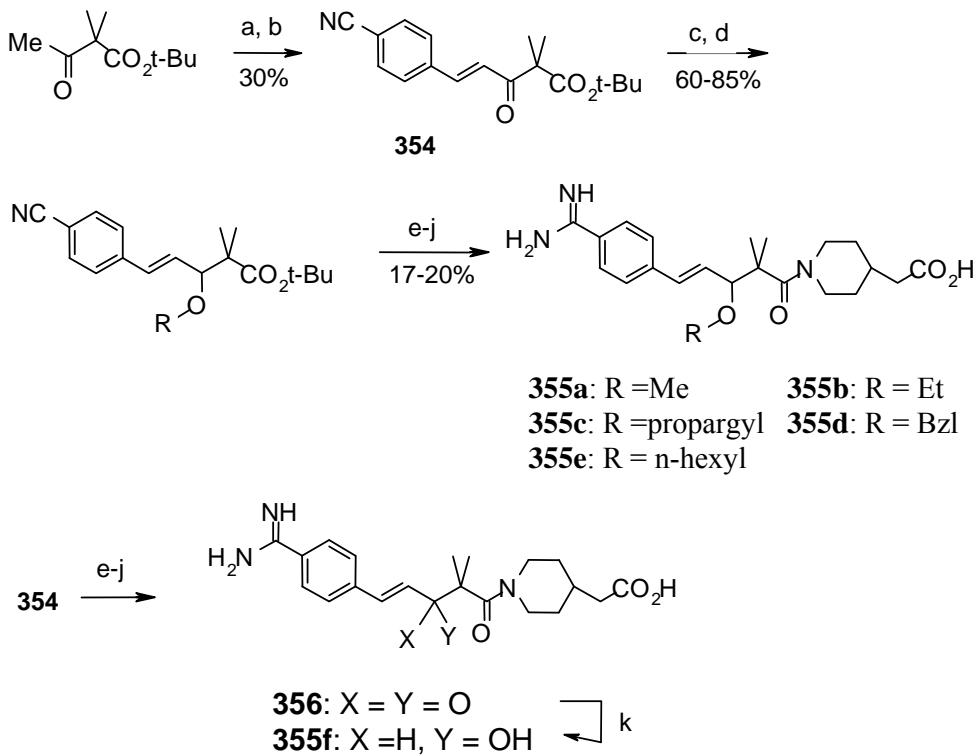

(a) Ti(O*i*Pr)<sub>4</sub>, NaCNBH<sub>3</sub>; (b) Et<sub>3</sub>N, DMF; (c) Cl-CH<sub>2</sub>-CO<sub>2</sub>Me, K<sub>2</sub>CO<sub>3</sub>, KI, DMF; (d) TFA/CH<sub>2</sub>Cl<sub>2</sub>=1/1; (e) HOAc/H<sub>2</sub>O=1/4, reflux; (f) RP-18 preparative HPLC (MeCN/H<sub>2</sub>O/0.1% TFA); (g) 5% Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>, reflux; (h) K<sub>2</sub>CO<sub>3</sub>, NMP, reflux; (i) BBr<sub>3</sub>, CH<sub>2</sub>Cl<sub>2</sub>, -75°C; (j) Br-(CH<sub>3</sub>)<sub>2</sub>C-CO<sub>2</sub>tBu, K<sub>2</sub>CO<sub>3</sub>, DMF; (k) Br-(CH<sub>2</sub>)<sub>3</sub>-CO<sub>2</sub>tBu, KI, K<sub>2</sub>CO<sub>3</sub>, DMF; (l) *I*: H<sub>2</sub>S, Et<sub>3</sub>N, pyridine. *ii*: MeI, acetone, reflux. *iii*: NH<sub>4</sub>OAc, MeOH, reflux; (m) *i*: NH<sub>2</sub>OH•HCl, KotBu, MeOH. *ii*: H<sub>2</sub>Pd/(C), HOAc.

Scheme 75.<sup>23</sup> Synthesis of compounds **329-341**.

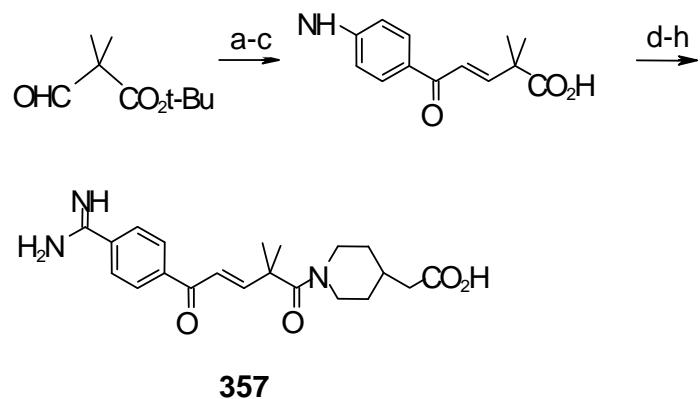

## 8.2 Benzamidine compounds containing a piperidine unit

Asari *et al.* synthesised a series of new GPIIb/IIIa inhibitors, NSL-95315 (**355a-f**, Scheme 76) and NSL-95317 (**357**, Scheme 77) with an (E)-double bond or an enone group adjacent to a benzamidine moiety. They found that molecules **355a** and **357** showed inhibitory activity for collagen-induced human platelet aggregation.<sup>23</sup>

(a) LDA, THF, 4-cyanobenzaldehyde; (b) MsCl, Py; (c) NaBH<sub>4</sub>, MeOH, CeCl<sub>3</sub>; (d) NaH, THF, alkyl iodide; (e) TFA; (f) methyl piperidine-4-acetate, CH<sub>2</sub>Cl<sub>2</sub>, BOP reagent; (g) H<sub>2</sub>S, Py, TEA; (h) MeI, acetone, reflux; (i) CH<sub>3</sub>COONH<sub>4</sub>, MeOH, reflux; (j) aq. NaOH, MeOH; (k) NaBH<sub>4</sub>, MeOH.

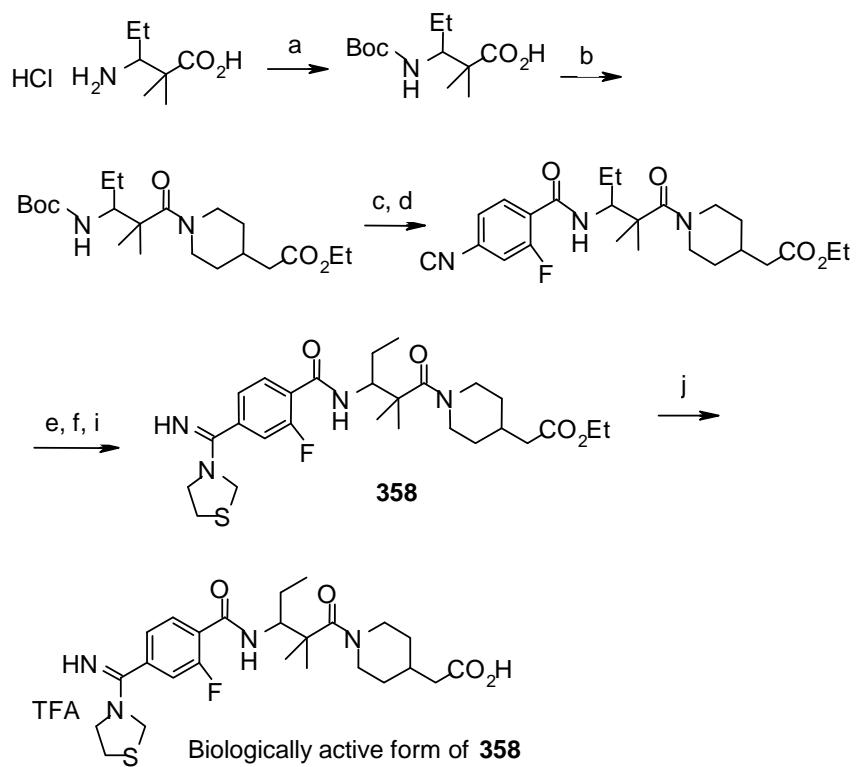

Scheme 76. The synthesis of inhibitor **355**.<sup>24</sup>

(a) 4-cyanoacetophenone, LDA, THF, -78°C, 1h; (b) MsCl, Py; (c) TFA; (d) methyl piperidine-4-acetate, CH<sub>2</sub>Cl<sub>2</sub>, BOP reagent, DIEA; (g) H<sub>2</sub>S, Py, TEA; (h) MeI, acetone; (i) CH<sub>3</sub>COONH<sub>4</sub>, MeOH; (j) aq. NaOH, MeOH.

Scheme 77. The synthesis of inhibitor **357**.<sup>24</sup>

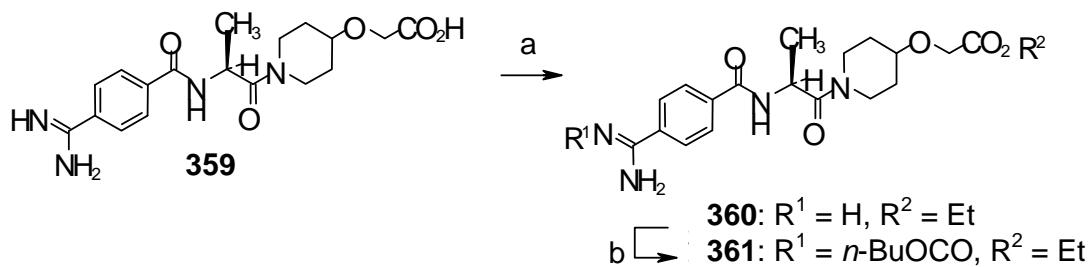

Hayashi *et al.* have synthesized a highly potent fibrinogen receptor inhibitor NSL-96184 (**358**, Scheme 78).<sup>24</sup> The compound shows inhibition of collagen-induced platelet aggregation in human PRP.

(a) (Boc)<sub>2</sub>O, 10% Na<sub>2</sub>CO<sub>3</sub>, dioxane; (b) benzyl, methyl, or ethyl piperidine-4-acetate, HATU, DIEA, CH<sub>2</sub>Cl<sub>2</sub>; (c) TFA, anisole, 0°C; (d) 2-halo-4-cyanobenzoic acid, WSCD\*HCl, HOEt, DMF; (e) H<sub>2</sub>S, Et<sub>3</sub>N, pyridine; (f) Mel, acetone, reflux; (g) CH<sub>3</sub>COONH<sub>4</sub>, MeOH, reflux; (h) Pd(OH)<sub>2</sub>, 90% aqueous MeOH containing 2% AcOH; or LiOH, 80% aqueous MeOH; (i) amine, MeOH, reflux; (j) LiOH, 80% aqueous MeOH.

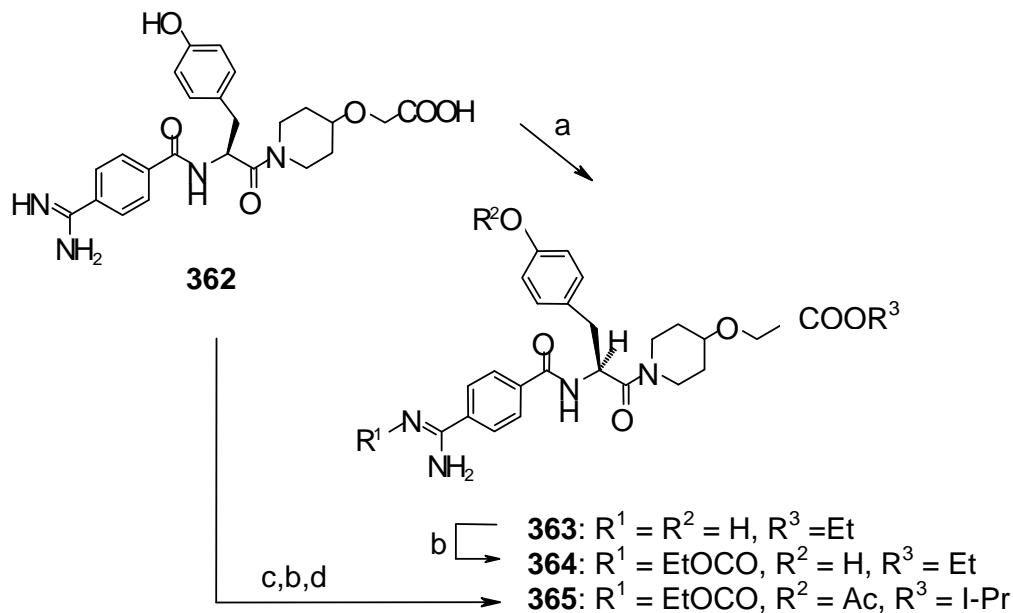

Scheme 78. The synthesis of compound **358**.<sup>25</sup>

Weller *et al.* have synthesized series of orally active prodrugs derived from potent and selective GPIIb/IIIa antagonists **359** (Scheme 79) and **362** (Scheme 80).<sup>25</sup>

(a) EtOH,  $H_2SO_4$ ; (b)  $n\text{-BuOCOCl}$ , NaOH,  $CH_2Cl_2$ .

Scheme 80. Preparation of prodrug derivatives of **362**.<sup>26</sup>

### 8.3 Other benzamidine compounds

See also 3.1, 4.1 and 5.1.

Weller *et al.* have synthesized orally active prodrug derivatives of a potent GPIb/IIIa antagonist **366** (Scheme 81) of which **370** is most potent.<sup>26</sup>

(a) 2-propanol,  $\text{H}_2\text{SO}_4$ ; (b)  $\text{EtOCOCl}$ ,  $\text{NaOH}$ ,  $\text{CH}_2\text{Cl}_2$ ; (c)  $\text{NH}_2\text{OH}\cdot\text{HCl}$ ,  $\text{Na}$ ,  $\text{MeOH}$ .

Scheme 81. Preparation of prodrug derivatives of **366**.<sup>26</sup>

Kottirsch *et al.* have synthesized several highly potent and orally active GPIb/IIIa antagonists based on a weak GPIb/IIIa antagonist, ornithine sulfonamide **371** (Fig. 28), the most potent antagonist being **379** (Table 20).<sup>26</sup>

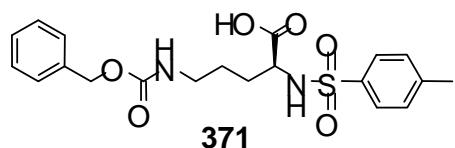

Figure 28.<sup>26</sup> A weak GPIb/IIIa antagonist.

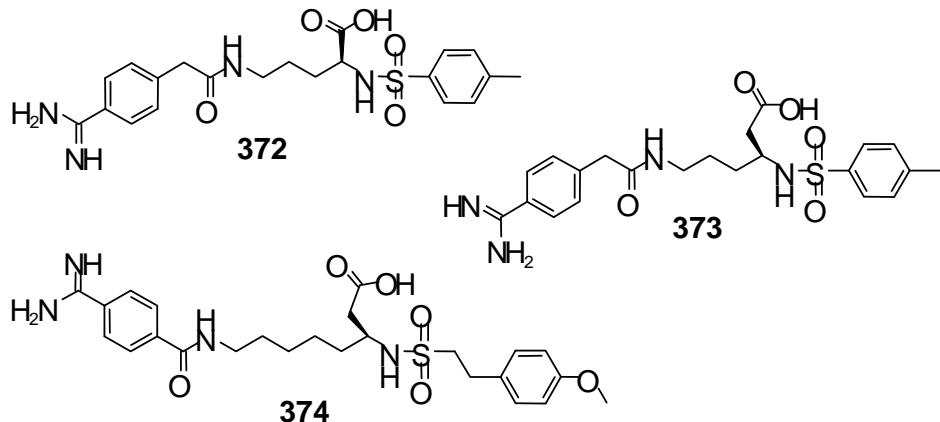

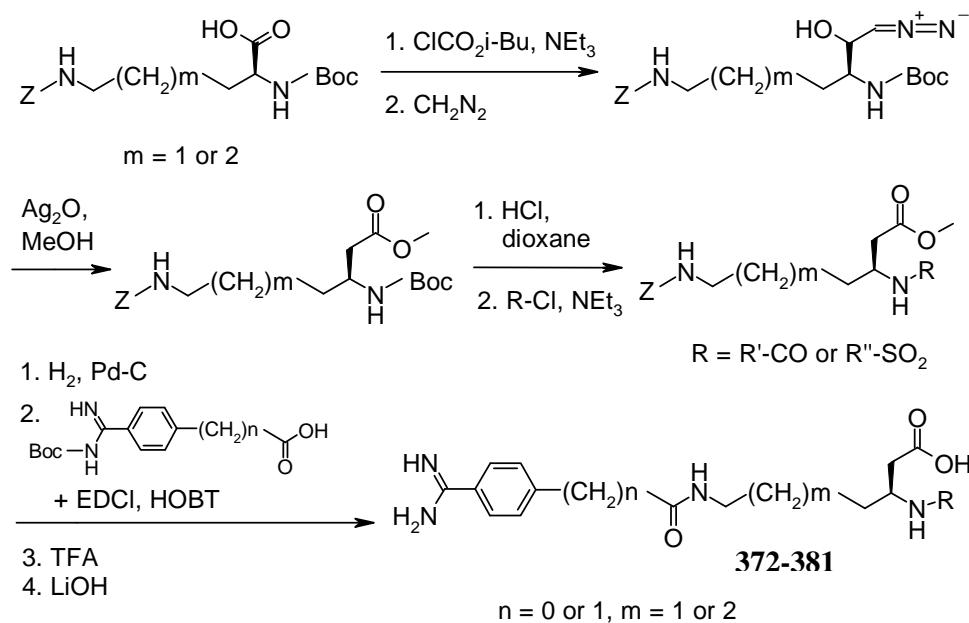

Figure 29. GPIIb/IIIa antagonists.

The synthesis of compounds **372-374** is described in Scheme 79. Compound **372** is only a weak GPIIb/IIIa antagonist, but a drastic increase in activity was obtained by adding a methylene group to the side chain to yield **373**.<sup>26</sup> Compound **374** is also a potent GPIIb/IIIa antagonist.

Scheme 82. Preparation of beta-amino acid GPIIb/IIIa antagonists.<sup>26</sup>

Compound **382** was synthesized from 4-azido-pentanoic acid by enantioselective  $\alpha$ -alkylation with tert-butyl bromo-acetate to give a Gly-Asp ethylene isostere which was converted to **382** using standard reaction conditions.

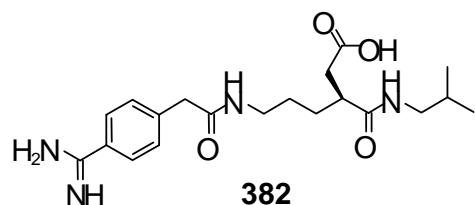

Figure 30.<sup>27</sup> A weak GPIIb/IIIa antagonist.

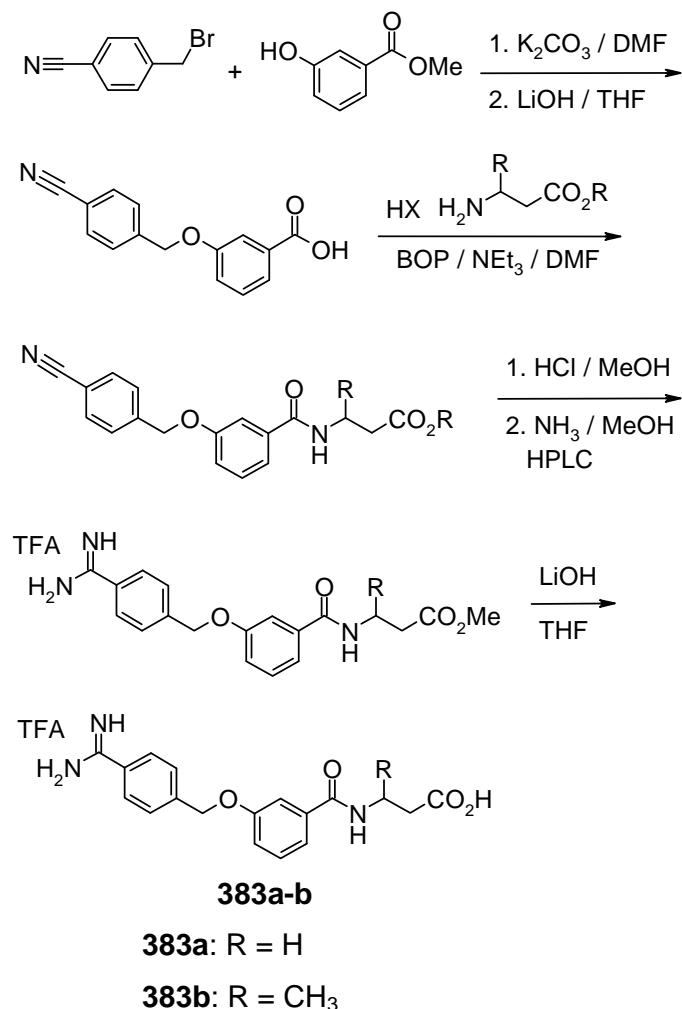

Table 20. Beta-amino acid-type GPIIb/IIIa antagonists.<sup>27</sup>

372-381					
No.	m, n	R	no.	m, n	R
<b>375</b>	1, 1		<b>379</b>	2, 0	
<b>376</b>	1, 1		<b>380</b>	2, 0	
<b>377</b>	1, 1		<b>381</b>	2, 0	
<b>378</b>	1,1				

When comparing **382** and **375** Kottirsch *et al.* found that the inverted amide bond in **375** increases activity in the platelet aggregation and fibrinogen binding assay 7-9-fold. They also found the *S*-enantiomer of **379** to be greatly more active an antagonist than the *R*-enantiomer.<sup>27</sup>

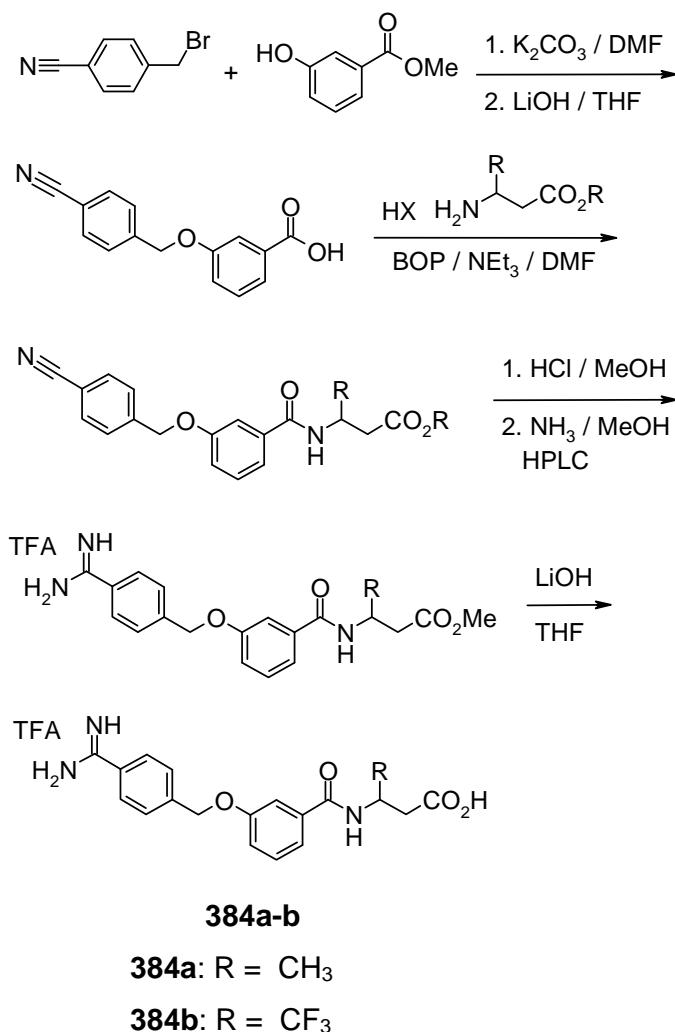

Xue *et al.* have investigated RGD mimetics with a 3-substituted benzoic acid core and a benzamidine moiety, and a series of  $\beta$ - and  $\alpha$ -substituted  $\beta$ -alanine derivatives as aspartic acid surrogates.  $\beta$ -Substitution of  $\beta$ -alanine with a methyl group was found to increase activity whereas a trifluoromethyl group decreased it.<sup>27</sup>

The replacement of  $\beta$ -alanine with  $N^2$ -substituted L-2,3-diaminopropionic acid derivatives caused a dramatic increase in activity.

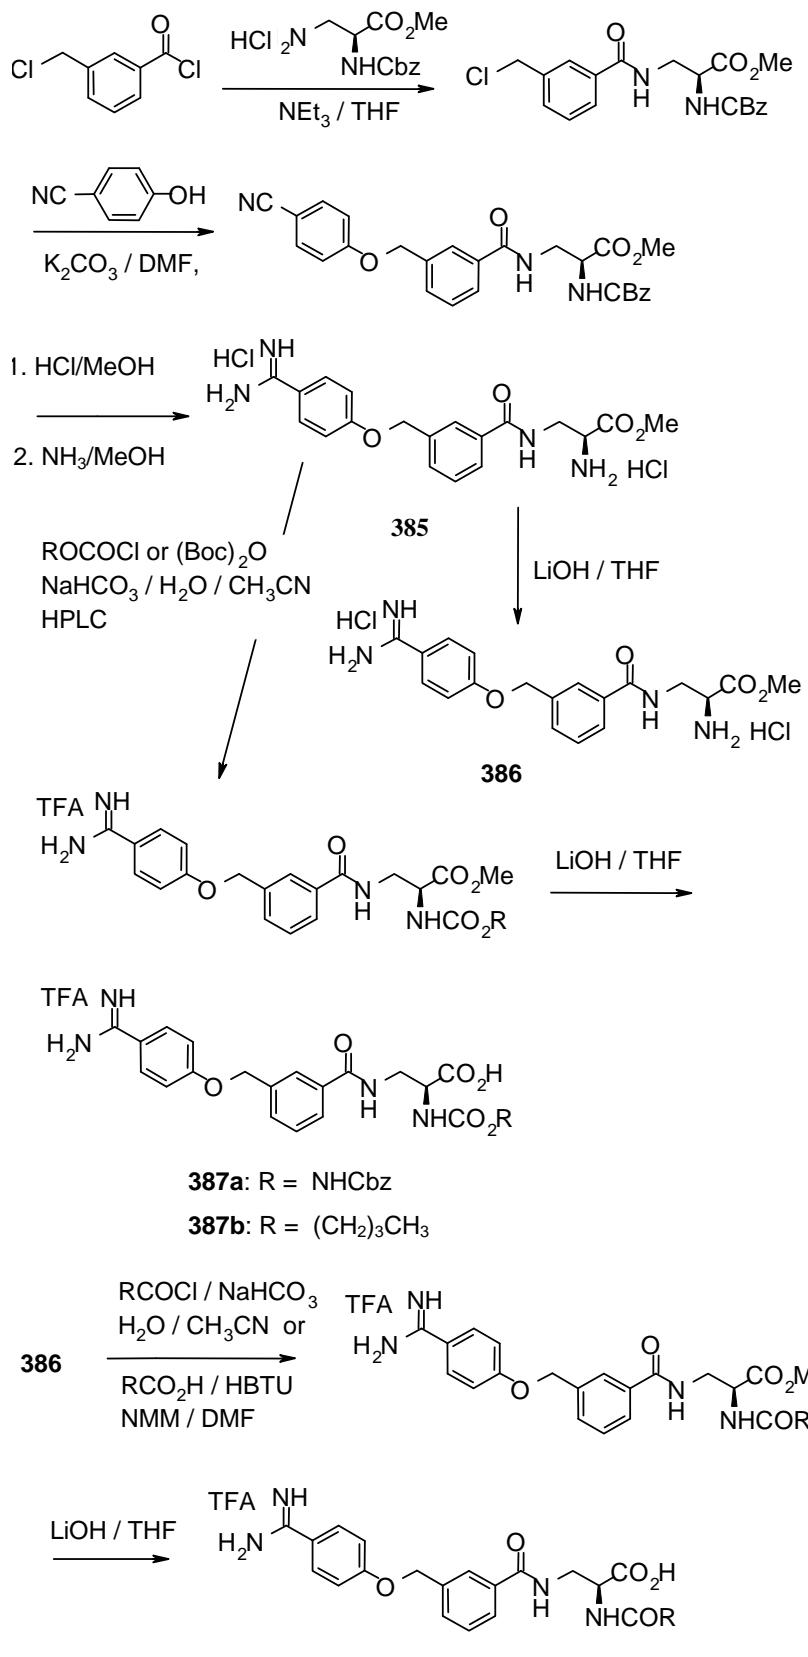

Scheme 83.<sup>28</sup> The synthesis of a  $\beta$ -alanine compound and its  $\beta$ -methyl derivative.

The  $\beta$ -methyl  $\beta$ -alanine compound yielded an improved inhibition of ADP-induced platelet aggregation in human PRP compared to the unsubstituted  $\beta$ -alanine compound.

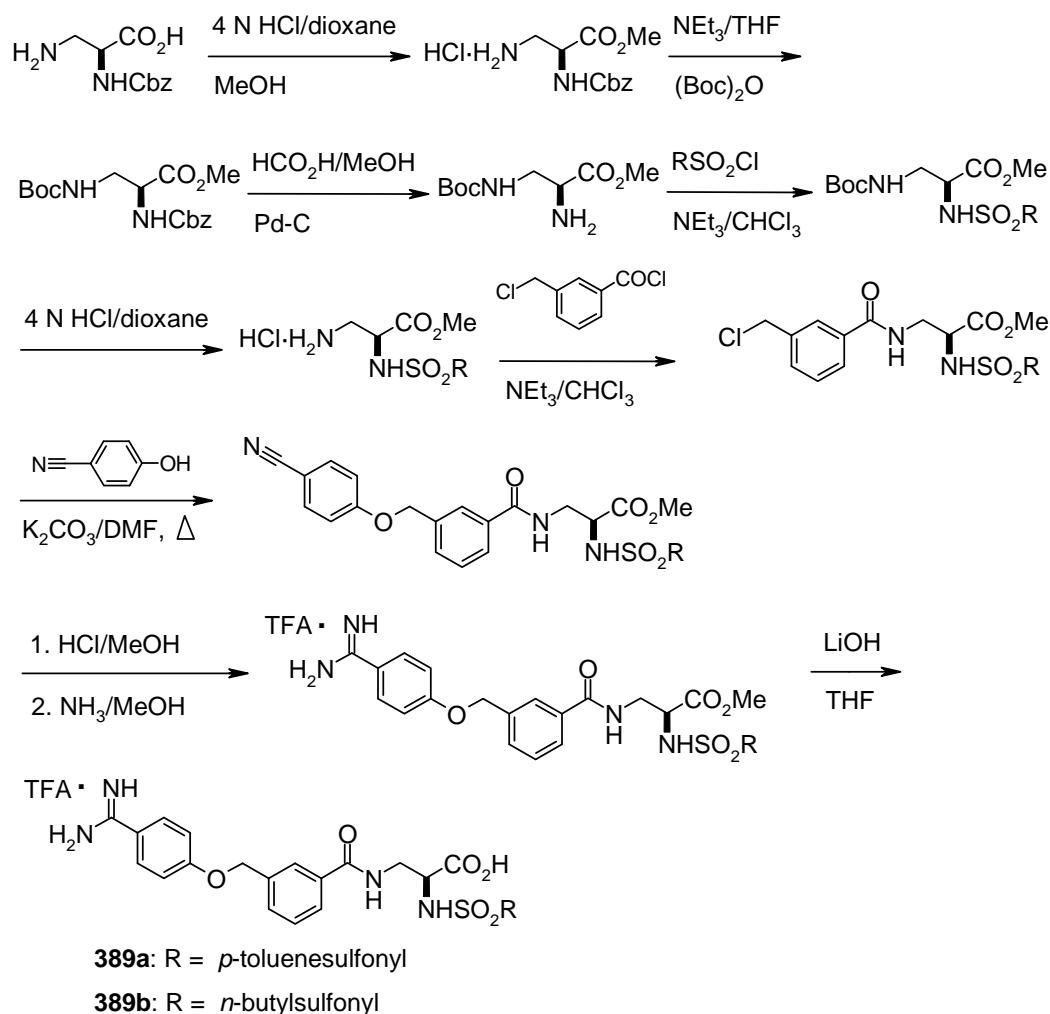

Scheme 84.<sup>28</sup> The synthesis of a  $\beta$ -methyl  $\beta$ -alanine compound and its trifluoromethyl derivative.

The  $\beta$ -trifluoromethyl derivative **384b** was found to have considerably lower inhibitory activity than the  $\beta$ -methyl compound **384a**. N<sup>2</sup>-substituted L-2,3-diaminopropionic acid derivatives (Scheme 85) afforded up to 100-fold enhancement in potency over the  $\beta$ -alanine.

Scheme 85.<sup>28</sup> The synthesis of compounds containing diaminopropionic acid derivatives.

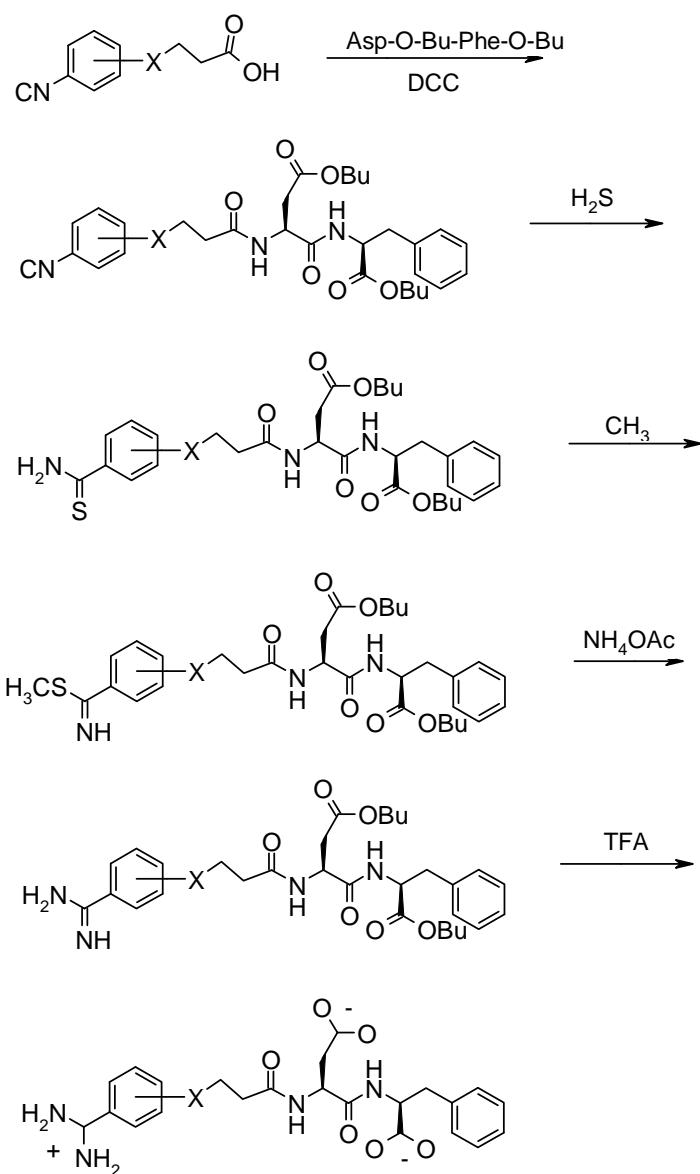

Scheme 86.<sup>27</sup> The synthesis of GPIIb/IIIa antagonists **389a-b**.

Preparation of **389a-b** was first attempted similar to the synthesis shown in Scheme 85 using compound **385** as starting material, but this route failed. Both **389a** and **389b** are potent GPIIb/IIIa antagonists, **389a** being slightly more active.<sup>27</sup>

The study of  $\alpha$ -substituents (sulfonamide, carbamate and amide) showed no apparent preference with respect to *in vitro* potency.<sup>27</sup>

Zablocki, Miyano *et al.* prepared a series of benzamide derivatives and measured their inhibition of collagen-induced platelet aggregation in canine PRP. The group found there is a 1000-fold increase in inhibitory potency over the natural RGDF ligand when the Arg-Gly of the RGDF sequence of the peptidomimetic has been replaced with 5-(4-amidinophenyl)pentanoyl mimetic. Benzamide was chosen since it has the charge localized on two nitrogens, as opposed to three in guanidine, allowing for more favorable electrostatic interactions with a negatively charged receptor site. Also, the reinforced ionic interaction provides a favorable alignment of dipole moments.<sup>29</sup>

Target compound

Scheme 87. The general synthetic sequence for *m*- and *p*-amidinophenyl derivatives.<sup>29</sup>

Table 21.<sup>29</sup> Target compound: Substituents of *p*-amidinophenyl based RGDF mimetics.

Amidino analogues were also prepared by way of an  $\alpha$ -substituted isoquinoline propionate and an  $\alpha$ -substituted isoquinoline acetate (Scheme 89). The desired molecules **405** and **407** were obtained from the intermediates **404** and **406** by using the same procedure as for compounds **403** (Scheme 88).

Scheme 89. The synthesis of two  $\alpha$ -substituted isoquinoline analogues.<sup>30</sup>

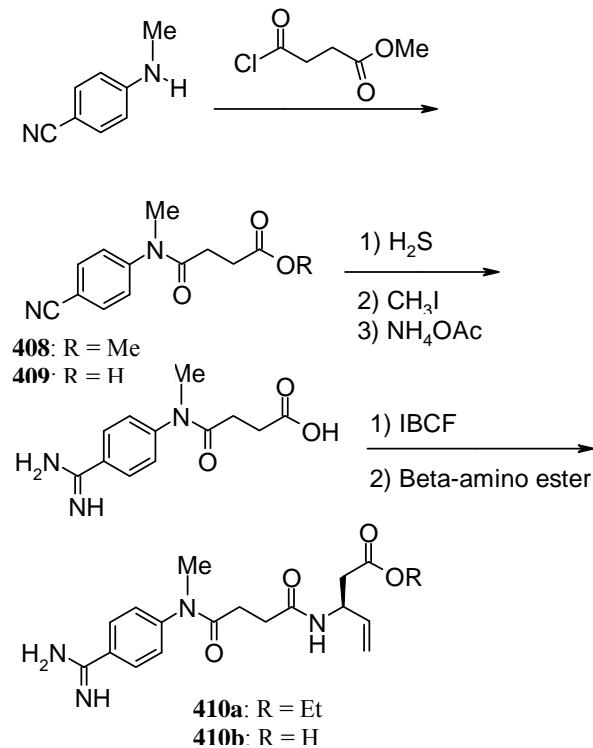

It was found that compared to the non-substituted isoquinoline propionate the alkyl substituents afforded a 10-fold increase in intrinsic activity and aryl substituents yielded a 40-fold improvement in inhibiting ADP induced platelet aggregation in human PRP.<sup>30</sup>

Zablocki, Rico *et al.* have prepared a series of compounds with an (aminobenzamidino)-succinyl (ABAS) Arg-Gly surrogate (Scheme 90).<sup>31</sup> Both ester prodrug and acid forms of the compounds were prepared.

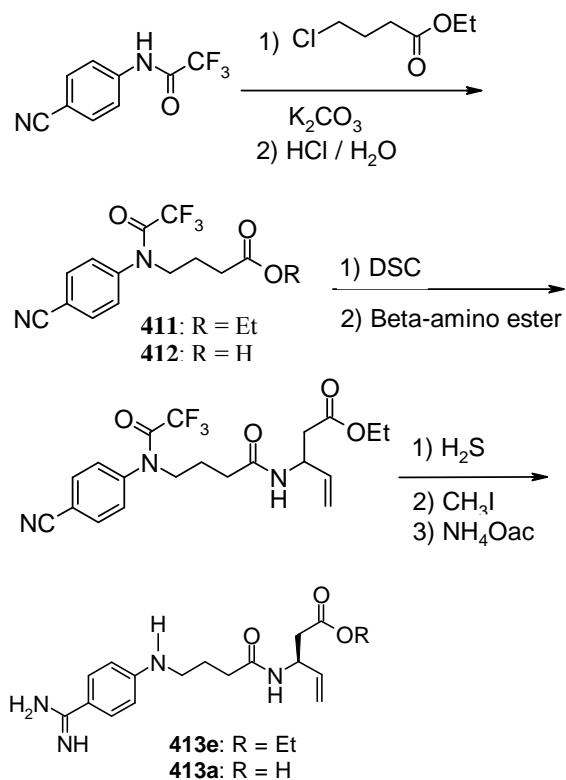

Scheme 90. The general synthetic sequence for the ABAS series.<sup>31</sup>

Several derivatives were prepared in which the amide bond adjacent to the benzimidazole was modified or replaced (Scheme 91). Also, an ester/acid pair of aniline derivatives was prepared (Scheme 92).

Scheme 91.<sup>31</sup> The synthesis of methylamino derivatives **410a-b**.

Scheme 92.<sup>31</sup> The synthesis of an ester/acid pair of aniline derivatives.

The most potent inhibitor of collagen-induced platelet aggregation in canine PRP was found to be an ABAS series molecule **414**:

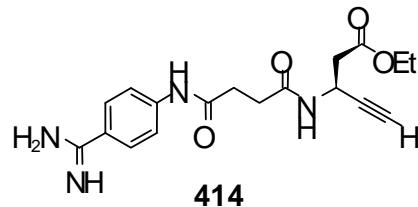

Figure 31.<sup>31</sup> A potent inhibitor of platelet aggregation.

## 9 Other piperazine compounds

### 9.1 2-oxopiperazine compounds

Sugihara *et al.* have designed and synthesized two possible GPIIb/IIIa antagonists **415a** and **416** based on the RGDF sequence, with (*S*)-1-(carboxymethyl)- and (*S*)-1-phenyl-ethyl-2-oxopiperazine-3-acetic acids as the Aso-Phe mimic and a {*trans*-[4-(guanidino-methyl)cyclohexyl]carbonyl}glycyl group as an Arg-Gly mimic. Compound **415a** was used as the lead compound due to its significant antiaggregatory activity and binding affinity, whereas compound **416** showed no activity.<sup>22</sup>

## 10 Other piperidine compounds

### 10.1 Piperidine compounds containing a sulfonamide group

Egbertson, Hartman *et al.* have synthesized a series of alkyl or aryl sulfonamide GPIIb/IIIa antagonists which show high activity for activated and unactivated platelet receptors. It appears the sulfonamide group such as that in **456** interacts with a binding site region cyclic inhibitors can't reach. Compound **456** shows excellent *in vivo* efficacy but its activity after oral administration is short-term. Analog **457** was chosen as the lead compound due to its favorable central constraint and active platelet inhibition in dogs. The aim was a more to find a more potent antagonist with a smaller required dosage.<sup>28</sup>

Scheme 109.<sup>34</sup> Synthesis of compound **508**.

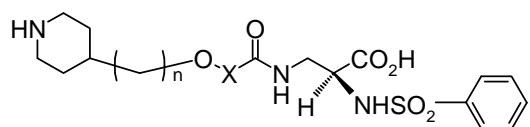

Brashear *et al.* have synthesized a series of potent GPIIb/IIIa inhibitors including **511a** which demonstrates great oral activity in the rhesus monkey.<sup>31</sup>

(a)  $\text{CH}_2\text{N}_2$  EtOAc; (b)  $\text{BBr}_3$ , THF; (c)  $\text{NaH}$ ,  $\text{MeI}$  or  $\text{BnBr}$ ; (d)  $\text{H}_2$ , 10%  $\text{Pd/C}$ ,  $\text{EtOH}$ ; (e)  $\text{X-OH}$ ,  $\text{DEAD}$ ,  $\text{PPh}_3$  in THF or  $\text{X-Cl}$ ,  $\text{Cs}_2\text{CO}_3$ , DMF; (f) 1 N  $\text{NaOH}$ , THF/MeOH; (g)  $\beta$ -alanine ester, BOP, NM,  $\text{CH}_3\text{N}$ ; (h)  $\text{HCl}$  (gas),  $\text{EtOAc}$ .

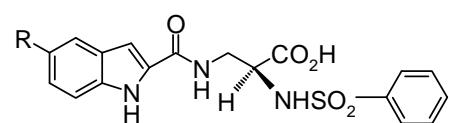

Scheme 110.<sup>35</sup> Synthesis of compound **511**.

Boc-protection of the *N*-terminus was applied in the syntheses of compounds **511a**, **511b**, **511h** and **511j**.<sup>35</sup>

Table 29.<sup>35</sup> Analogues **a-g** of compound **511**.

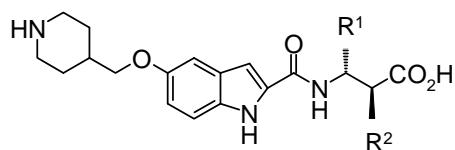

Compound	n	R
<b>511a</b>	1	
<b>511b</b>	2	
<b>511c</b>	1	
<b>511d</b>	1	
<b>511e</b>	1	
<b>511f</b>	2	
<b>511g</b>	1	

The greater potency of compounds **511a** and **511b** shows that the 2-position on the indole ring is the preferred position of the acid terminus. The difference in potency between a one-carbon linker and a two-carbon linker was found not significant.<sup>35</sup>

Table 30.<sup>35</sup> Analogues **h-l** of compound **511**.

Compound	R
<b>511h</b>	
<b>511i</b>	
<b>511j</b>	
<b>511k</b>	
<b>511l</b>	

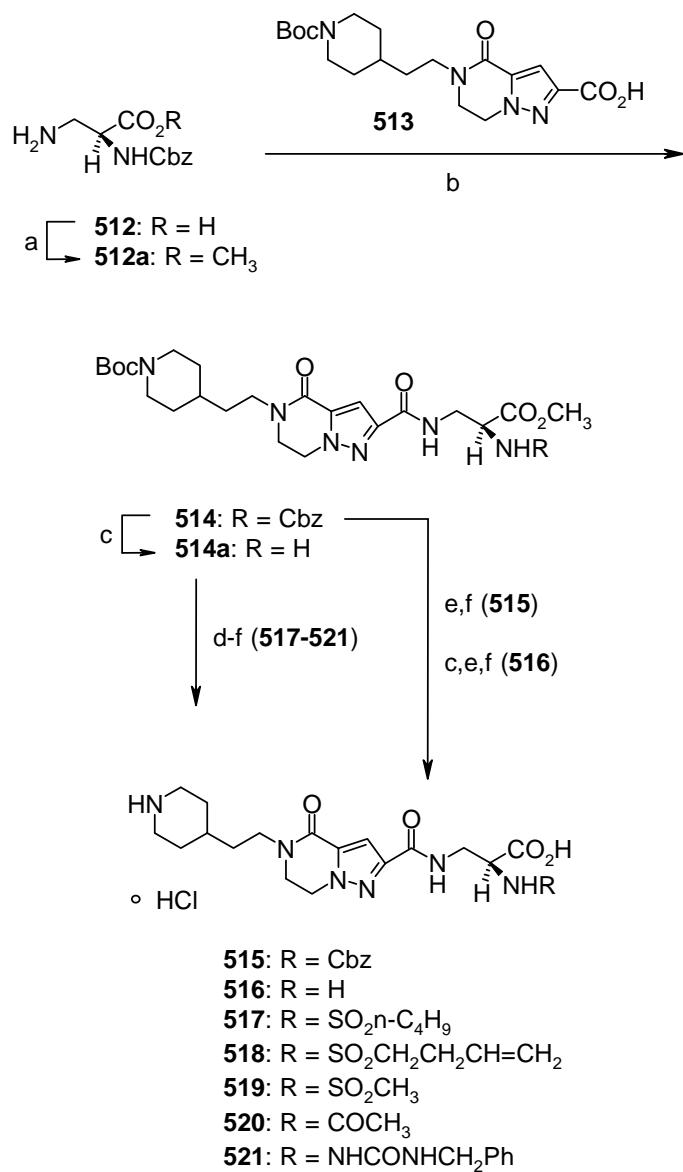

The more basic compounds **511h** (as well as **511a** and **511b**) showed more potency than the less basic compounds **511i-l**.<sup>35</sup>

Table 31.<sup>35</sup> Analogues **m-q** of compound **511**.

Compound	R <sup>1</sup>	R <sup>2</sup>
<b>511m</b>	H	H
<b>511n</b>	( <i>R,S</i> )-pyrid-3-yl	H
<b>511o</b>	H	NHSO <sub>2</sub> Ph 
<b>511p</b>	H	NHSO <sub>2</sub> -
<b>511q</b>	H	NHSO <sub>2</sub> -

Compounds **511p** and **511q** showed excellent affinity in platelet aggregation but could not sustain it for long as opposed to **511a**.<sup>35</sup>

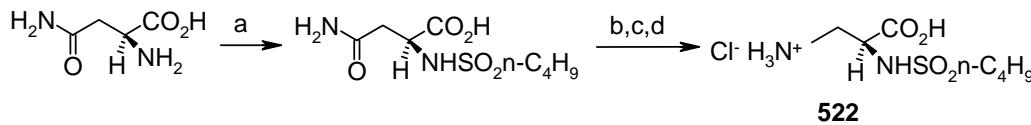

Askew, McIntyre *et al.* have synthesized a series of pyrazolopiperazinone fibrinogen receptor antagonists including an orally active and selective GPIIb/IIIa inhibitor, compound **517** (L-734,115).<sup>32</sup>

(a) HCl, MeOH, (100%); (b) **512a**, EDC, HOBT, DMF, (95%); (c) H<sub>2</sub>, 10% Pd/C, EtOH, (100%); (d) RSO<sub>2</sub>Cl, RCOCl, or RNCO, CH<sub>2</sub>Cl<sub>2</sub>, Et<sub>3</sub>N, (65-100%); (e) LiOH, THF, H<sub>2</sub>O, (100%); (f) HCl, EtOAc, 0°C, (85-98%).

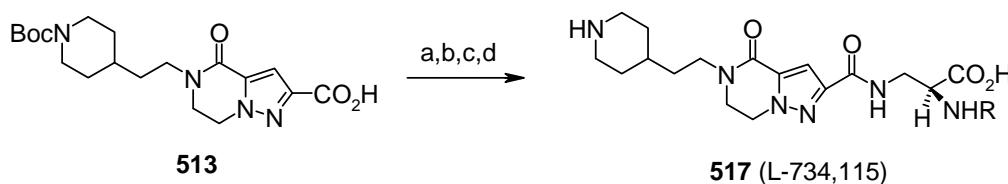

Scheme 108.<sup>36</sup> Synthesis of compounds **515-521**.

A high yield of compounds **515-521** was obtained by the synthesis described in Scheme 108. However, because of the 10-15% racemization during the ester hydrolysis an alternate route was developed (Schemes 109-110).<sup>36</sup>

(a) *n*-BuSO<sub>2</sub>Cl, 50% aqueous dioxane, (65%); (b) Br<sub>2</sub>, NaOH; (c) Boc<sub>2</sub>O, THF, (85%); (d) HCl, EtOAc, (98%).

Scheme 109.<sup>36</sup> Synthesis of compound **522**.

(a) *i*-BuCOCl, N-methylmorpholine, THF, 0°C, (98%); (b) **522**, THF/H<sub>2</sub>O, 0°C, (83%); (c) HCl, EtOAc, 0°C, (100%); (d) ion exchange chromatography, Dowex 50XB-200, (85%).

Scheme 110.<sup>36</sup> Non-racemizing synthesis of compound **517**.

Liverton *et al.* have synthesized a series of 3,6-substituted quinazolinedione and quinazolinone fibrinogen receptor antagonists with good *in vitro* activity. The activity after i.v.infusion in dogs was however short-term.<sup>33</sup>

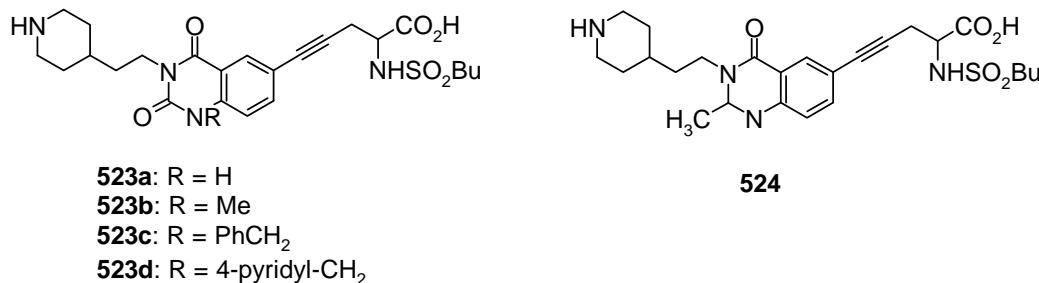

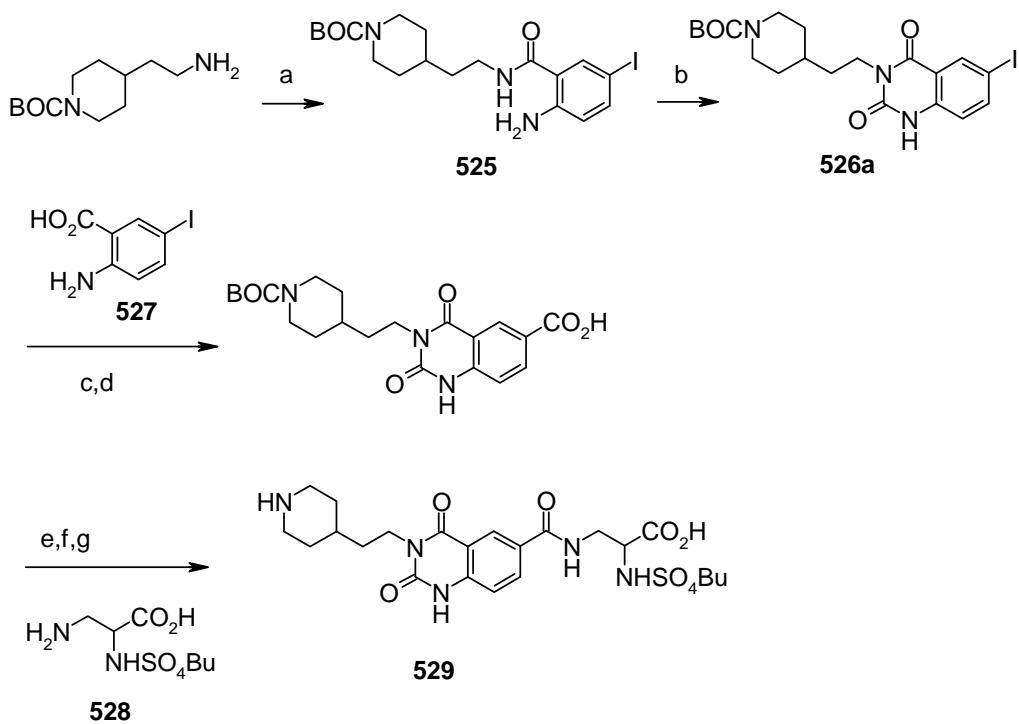

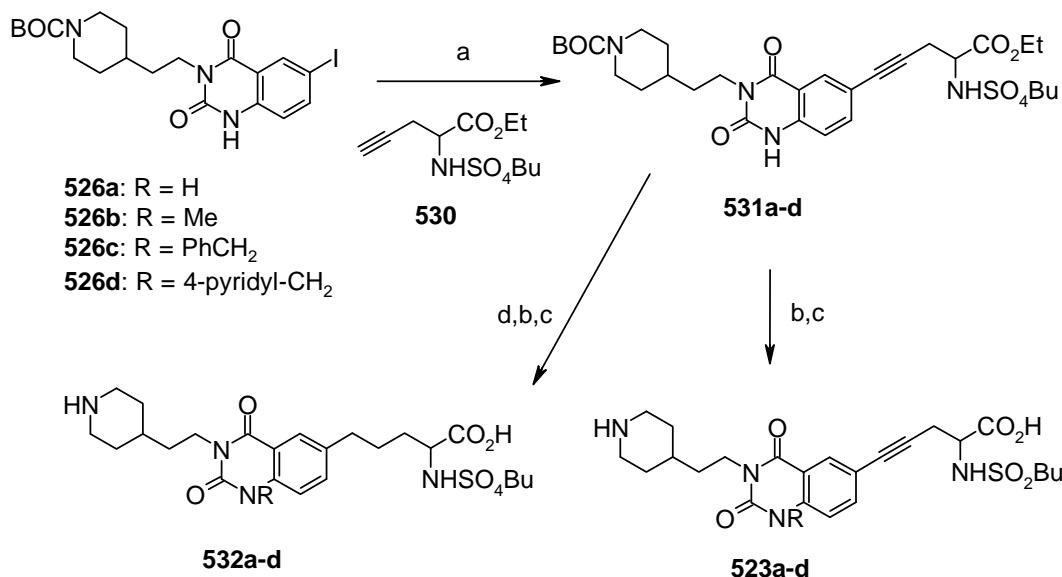

Figure 37.<sup>37</sup> Target compounds **523a-d** and **524**.

(a) EDC, HOBr,  $\text{NEt}_3$ , DMF, rt, 56%; (b) carbonyldiimidazole, THF, 60°C, 3 h, 70%; (c)  $\text{Pd}(\text{PPh}_3)_4$ , CO (balloon), toluene, slow addition of  $\text{Bu}_3\text{Sn}$ , 50°C; (d)  $\text{H}_2\text{O}_2$ ,  $\text{NaClO}_2$ , phosphate buffer pH 4.3, rt; (e) **528**, EDC, HOBr,  $\text{NEt}_3$ , DMF, rt; (f) LiOH, THF,  $\text{H}_2\text{O}$ ; (g) HCl, EtOAc, 0°C.

Scheme 111.<sup>37</sup> Synthesis of compound **529**.

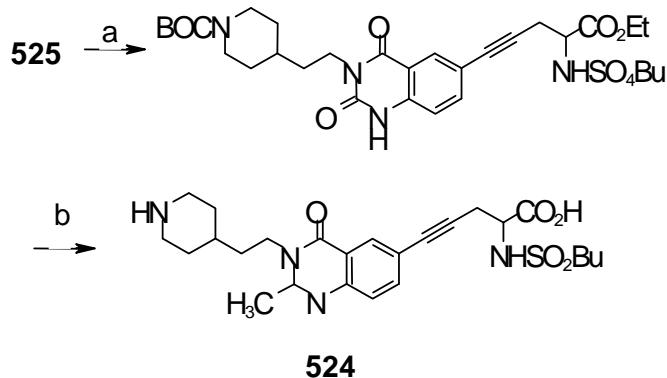

Compound **529** shows potency toward platelet aggregation inhibition but the substitution of C-terminal amide linkage with an acetylene gives compound **523a** 17-fold increase in activity.<sup>37</sup>

(a) **530**, Pd(PPh<sub>3</sub>)<sub>4</sub>, CuI, HNEt<sub>2</sub>, 40°C; (b) LiOH, THF, H<sub>2</sub>O; (c) HCl, EtOAc, 0°C; (d) H<sub>2</sub>, 50psi, Pd/C, EtOAc.

Scheme 112.<sup>37</sup> Synthesis of compounds **523a-d** and **532a-d**.

The reduction of the acetylene as in compounds **532a-d** resulted only in slight decrease in activity as did the N1-substitutions (compounds **523b-d** and **532b-d**).<sup>37</sup>

(a) (EtO)<sub>3</sub>CH, 160°C, 3 h, 93%; (b) steps a,b,c from Scheme 110.

Scheme 113.<sup>37</sup> Synthesis of compound **524**.

Misra *et al.* have synthesized a group of human α-thrombin inhibitors based on the potent and selective thrombin inhibitor Argatroban (compound **533**)<sup>34</sup>

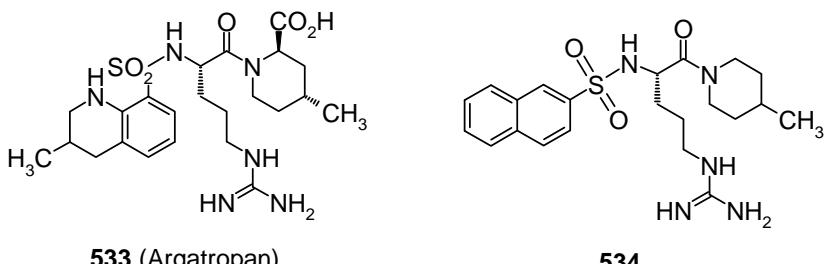

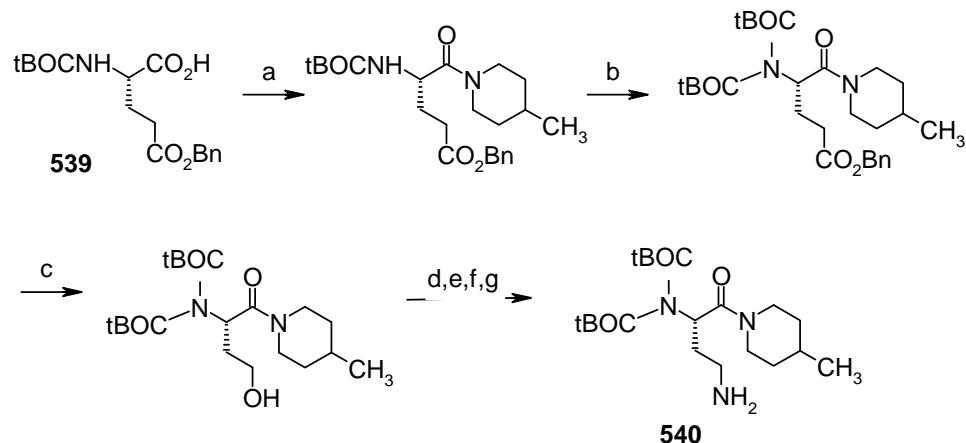

Figure 38.<sup>38</sup> Thrombin inhibitor **533** and its structurally simplified analog **534**.

Table 32.<sup>38</sup> The substituents of arylsulfonamides **535a-b**, **536a-b**, **537** and **538**.

Scheme 122. Preparation of compounds **569**, **569a** and **570**.<sup>26</sup>

Compound **568** was derived from compound **362** (Scheme 80 (8.2) by coupling of *N*-Z-Tyr-OH with *tert*-butyl (4-piperidinyloxy)acetate followed by catalytic hydrogenation.<sup>26</sup>

Xue *et al.* have synthesized potent GPIIb/IIIa antagonists (see also 8.3) including **572**. The *N*-amidinopiperidin-4-yl group proved to yield a higher potency than the smaller piperazine or piperidine groups of **571a-c**.<sup>28</sup>

Scheme 123.<sup>28</sup> Synthesis of compounds **571a-c** and **572**.

Egbertson, Naylor *et al.* have synthesized a group of m-phthalic acid analogs based on the fibrinogen receptor antagonist **573**, and subsequently a potent, selective and orally active fibrinogen receptor antagonist, compound **579**.<sup>36</sup>

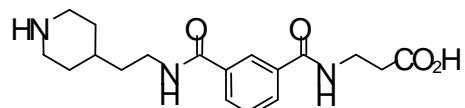

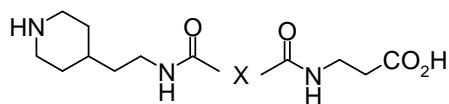

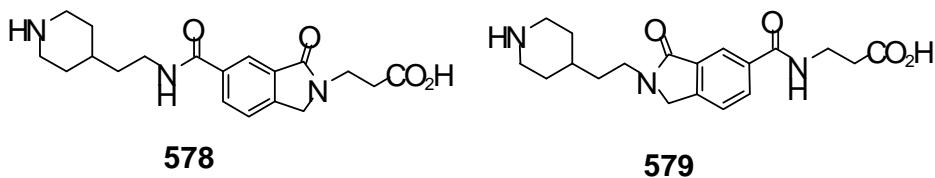

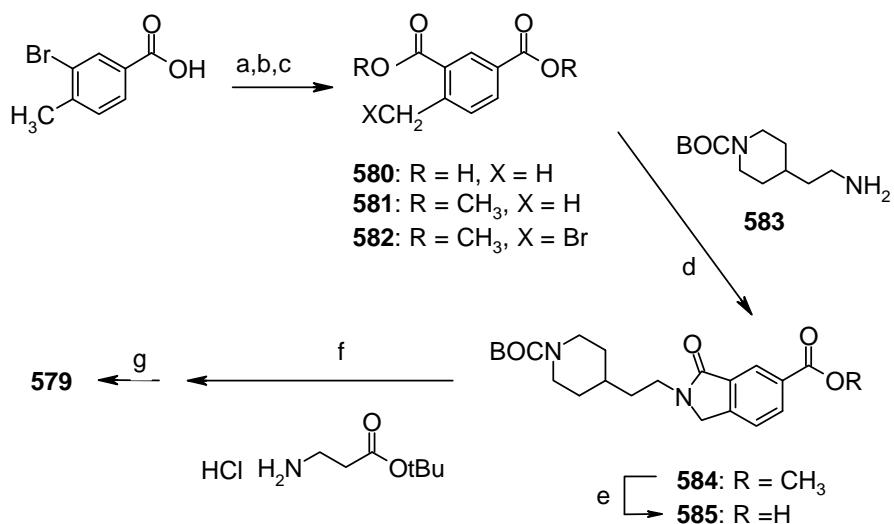

Figure 39.<sup>40</sup> Lead compound **573**.

Table 33. Pyridine analogs of compound **573**.<sup>40</sup>

Compound	X
<b>574</b>	
<b>575</b>	
<b>576</b>	
<b>577</b>	

Compounds **574-576** show relatively similar potency to each other, whereas compound **577** demonstrated a potency 100-fold smaller. It was calculated that the position of the pyridine nitrogen causes the molecule to favor a rotational isomeric in which dipole moments are opposed instead of aligned, making compound **577** less potent than the other analogs. This lead to the design of the constrained isoindolinone compounds **578** and **579** in which the carbonyl groups are in the same plane as the phenyl ring.<sup>40</sup>

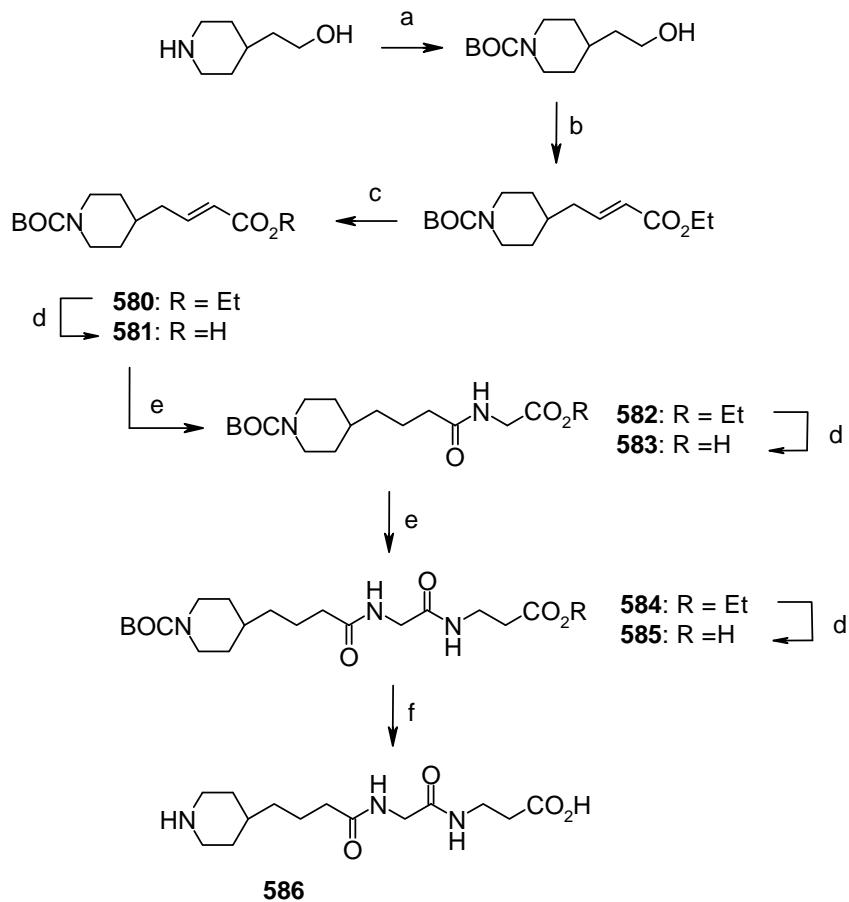

Figure 40. Constrained amide fibrinogen receptor antagonists.<sup>40</sup>

## 13 Summary

Most of the research concerning non-peptide integrin inhibitors is focused on the RGD (Arg-Gly-Asp) sequence which is recognized by the platelet fibrinogen receptor  $\alpha_{IIb}\beta_3$  (GPIIb/IIIa) and the vitronectin receptor  $\alpha_V\beta_3$ .<sup>5</sup>

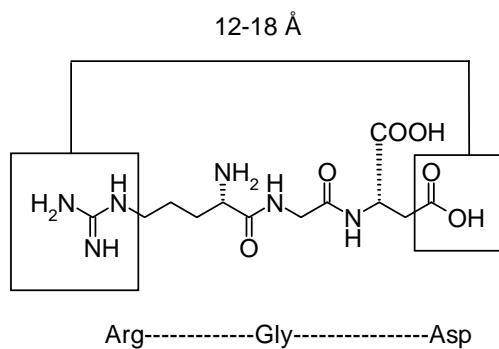

Figure 1.<sup>1</sup> RGD sequence.

The RDG sequence plays a key part in aggregation of platelets causing vaso-occlusive disorders such as unstable angina, myocardial infarction, transient ischemic attacks, stroke and thrombosis ( $\alpha_{IIb}\beta_3$ ).<sup>32,36</sup> Also, it's involved in osteoclast-mediated bone resorption -  $\alpha_V\beta_3$  is present in osteoclasts but not bone forming osteoblasts.<sup>39</sup>

The less studied  $\alpha_{IV}\beta_1$ , VLA-4 (very late antigen 4) found in stimulated monocytes and lymphnotes binds to cytokine-activated endothelial cells and to fibronectin causing diseases such as asthma and multiple sclerosis.<sup>43</sup>

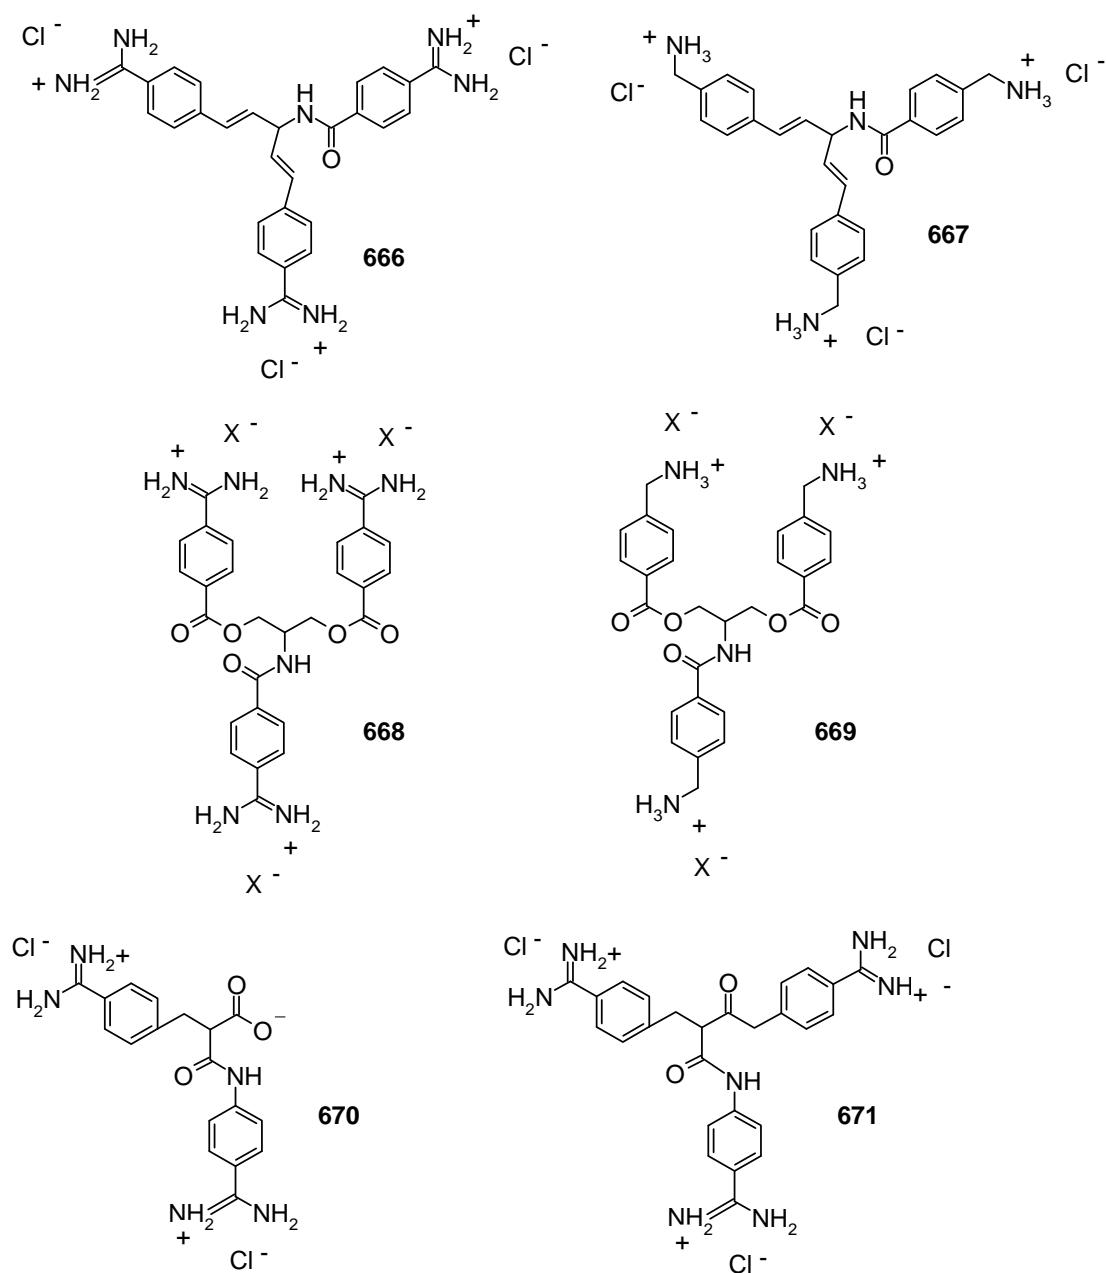

When evaluating the potency of non-peptide GPIIb/IIIa inhibitors tricyclic form seems to be favoured over tetracyclic form.<sup>3</sup>

Lipophilic substituents at  $\alpha$  or  $\beta$  to the carboxylate moiety often result in increased potency.<sup>8,20</sup> Aliphatic or aromatic residues are favorable compared to carboxy terminal serine.<sup>13</sup> Benzamide and piperidine groups are highly beneficial N-terminal substituents, with benzamide having the positive charge localized on two nitrogens allowing for favorable electrostatic interactions with a negatively charged receptor site.<sup>29</sup>

## EXPERIMENTAL SECTION

### 14 Preface

The aim of the experimental work was to synthesize a potential nonpeptide inhibitor for the integrin  $\alpha_{II}\beta_1$ . Twelve target molecules (fig. 43, molecules **666-677**) were designed by professor Kari Rissanen based on the information gathered by Bio-Tie Therapies.

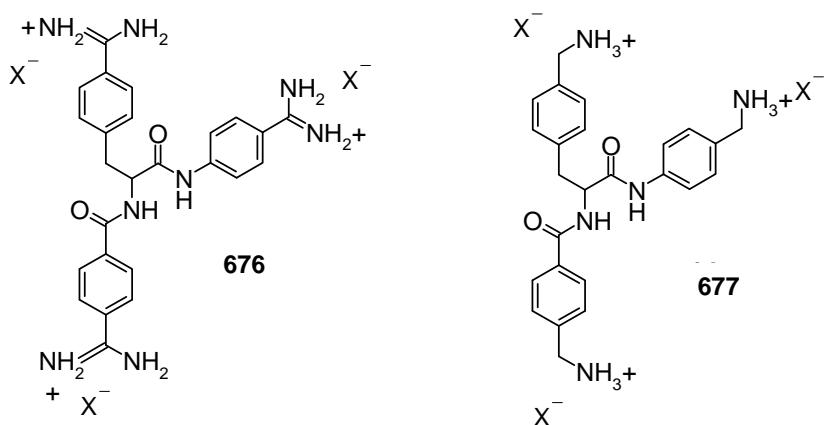

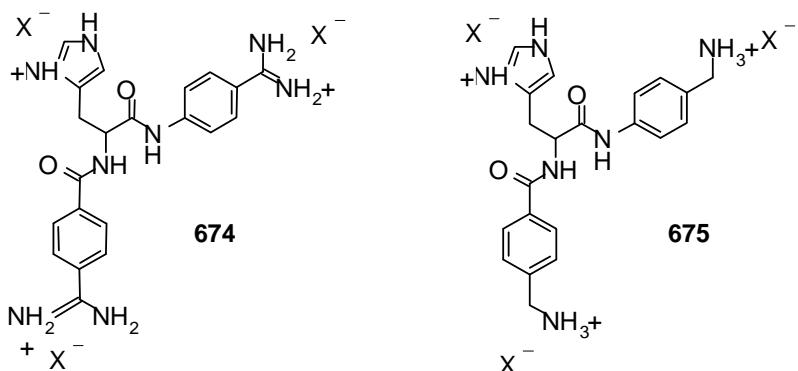

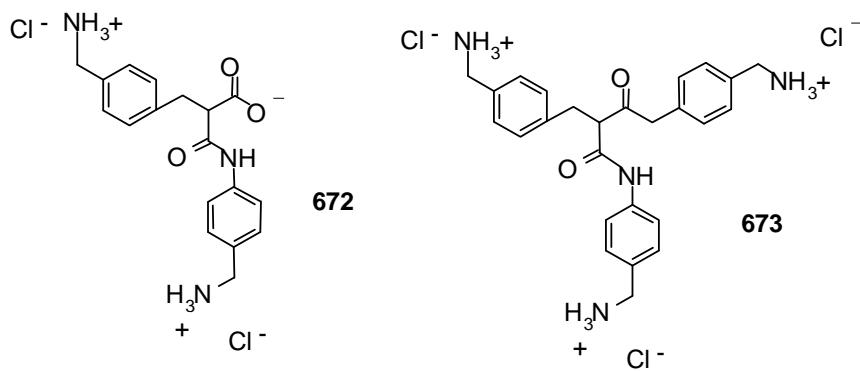

Figure 43. The target molecules.

Molecules **666-669**, **671**, **673**, **676** and **677** showed binding potential on a computer model of the integrin  $\alpha_{II}\beta_1$  due to their suitable size, flexibility and three branches with negative charges. Molecules **674** and **675** showed some binding potential.

## 15 The plan for synthesis

The plan was to try to synthesize as many of the target molecules as possible by constructing a neutral molecule of smaller molecules and then reducing it. Due to the limited time the syntheses of only molecule **669** and modified versions of molecules **673** and **677** were attempted.

First, the reduction reaction was to be tested on the small molecule **680** with a cyano group and an ester bond in order to see whether the ester bond would tolerate the conditions without breaking.

## 16 The syntheses

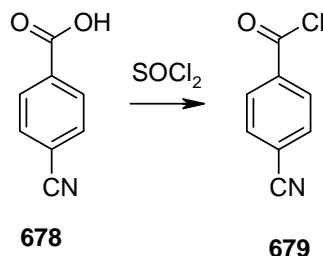

### 16.1 The synthesis of target molecule 669

#### 16.1.1 4-Cyanobenzoyl ethyl ester 680

The synthesis was done by following the synthesis route for ethylvinyl acetate<sup>40</sup>.

##### 16.1.1.1 4-Cyanobenzoyl chloride 679

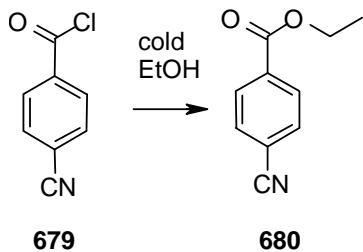

Since the 4-cyanobenzoyl chloride needed as a starting material was in an opened container an <sup>1</sup>H NMR spectrum was obtained. According to the spectrum some of the chloride had turned into its acid form. It was estimated that the acid / acid chloride ratio in the starting material was 1:1.

Scheme 136. The synthesis of 4-cyanobenzoyl chloride **679**.

A two-necked flask is equipped with a reflux condenser and a gas trap. Approximately 20 mL  $\text{SOCl}_2$  is heated gently in the flask on a water bath with stirring and 1.29 g (8.28 mmol) acid **678** / acid chloride **679** mixture is added during 30 minutes. The mixture is heated gently for 30 minutes. The liquid is removed by a rotatory evaporator. The yield is 1.45 g (8.74 mmol).

### 16.1.1.2 4-Cyanobenzoyl ethyl ester **680**

Scheme 137. The synthesis of 4-cyanobenzoyl ethyl ester **680**.

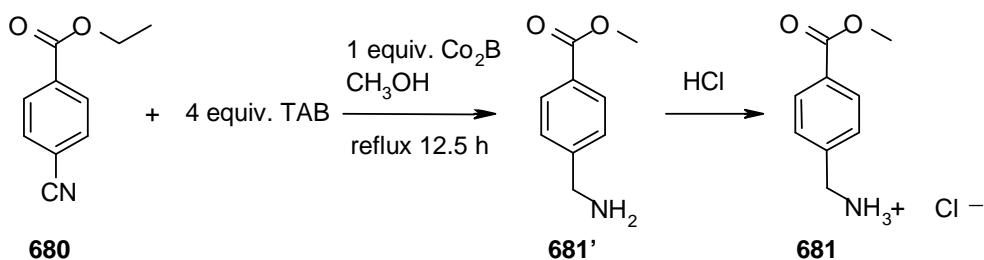

Approximately 30 mL abs. ethanol is cooled on ice. All of the acid chloride **679** from 3.1.1.1 is added slowly with stirring. The ice bath is removed and the mixture is allowed to stand for 1 h. The liquid is removed by a rotatory evaporator. The yield is 1.37 g (7.8 mmol).

<sup>1</sup>H NMR (AC-d6):  $\delta$  = 8.19-8.17 (m, 2H), 7.95-7.92 (m, 2H), 4.42-4.38 (m, 2H), 2.78 (s, 1H), 1.41-1.37 (m, 3H) ppm.

<sup>13</sup>C NMR (AC-d6):  $\delta$  = 206.30, 206.15, 205.99, 165.56, 135.40, 133.45, 130.92, 118.72, 117.16, 62.40, 30.47, 30.38, 30.32, 30.27, 30.17, 30.07, 29.92, 29.77, 29.61, 29.46, 14.55 ppm.

### 16.1.2 *p*-Ethyl ester benzyl amine **682'**

#### 16.1.2.1 *p*-Methyl ester benzyl amine **681'**

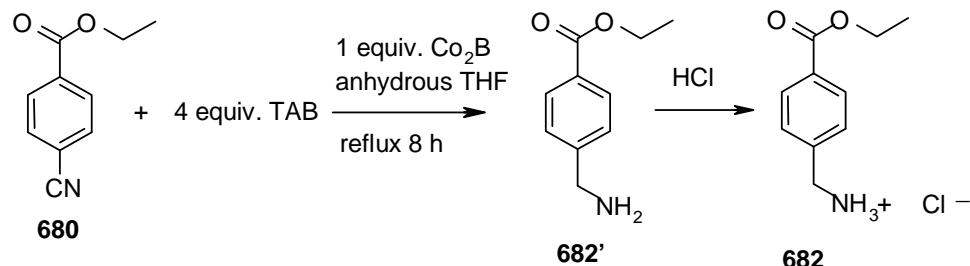

Scheme 138. The synthesis of *p*-methyl ester benzyl amine<sup>41</sup> **681'** and its chloride salt **681**.

Approximately 50 mL methanol, 0.37 g (2.89 mmol)  $\text{Co}_2\text{B}$ , 1.00 g (11.52 mmol) TAB and 0.50 g (2.85 mmol) 4-cyanobenzoyl ethyl ester **680** are refluxed with stirring for 12.5 h. The liquid is removed by a rotatory evaporator. The amine **681'** is extracted with approximately 50mL  $\text{CHCl}_3$  and the solid removed by filtering.

The amine is extracted from the chloroform as an ammonium salt **681** by using 2 M HCl. The acidic solution is made basic with 2 M NaOH and the amine removed by filtering. The yield is 0.01 g. A mixture of products is obtained possibly due to intermolecular bonding.

The basic solution from 3.1.2.1 is condensed to 30 mL and made acidic with HCl in order to transform the possibly present **681'** into an ammonium chloride. The solution is evaporated with a rotatory evaporator. No desired product is present.

#### 16.1.2.2 *p*-Ethyl ester benzyl amine **682'** in anhydrous THF

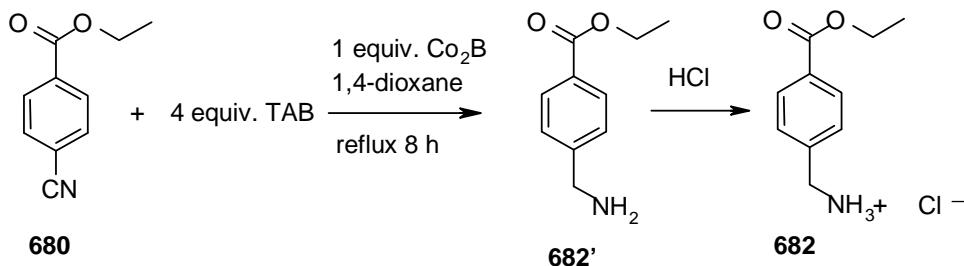

Scheme 139. The synthesis of *p*-ethyl ester benzyl amine **682'** in anhydrous THF and its chloride salt **682**.

0.29 g (2.28 mmol)  $\text{Co}_2\text{B}$ , 0.69 g (8.00 mmol) TAB and 0.38 g (2.20 mmol) ester **680** are ground to a powder and added to a flask containing 40 mL anhydrous THF. The mixture is refluxed in an oil bath with stirring for eight hours. The solution is evaporated with a rotatory evaporator. The product is extracted with 40 mL  $\text{CHCl}_3$  and the solid removed by filtering.

Extraction with HCl: 3 mL of 2 M HCl is diluted with water to 35 mL which is then used to extract the  $\text{CHCl}_3$  solution. The solution is evaporated with a rotatory evaporator.

The yield is 1.33 g. No desired product is detected.

### 16.1.2.3 *p*-Ethyl ester benzyl amine **682'** in 1,4-dioxane

Scheme 140. The synthesis of *p*-ethyl ester benzyl amine **682'** in 1,4-dioxane and its chloride salt **682**.

0.29 g (2.28 mmol)  $\text{Co}_2\text{B}$ , 0.70 g (7.99 mmol) TAB and 0.39 g (2.20 mmol) ester **680** are ground to a powder and added to a flask containing 40 mL 1,4-dioxane. The mixture is refluxed in an oil bath with stirring for eight hours. The solution is evaporated with a rotatory evaporator. The product is extracted with 40 mL  $\text{CHCl}_3$  and the solid removed by filtering.

Extraction with HCl: 3 mL of 2 M HCl is diluted with water to 35 mL which is then used to extract the  $\text{CHCl}_3$  solution. The solution is evaporated with a rotatory evaporator.

The yield is 1.24 g.

The removal of *tert*-butyl ammonium chloride from the solid is attempted by dissolving the possible desired product **682** in  $\text{CHCl}_3$ :

The solid is added to 40 mL  $\text{CHCl}_3$ . The solution is stirred and let stand for a while. The remaining solid is removed by filtering and the cloudy  $\text{CHCl}_3$  solution evaporated with a rotatory evaporator. The result is a fine white powder.

The yield is 0.08 g. No desired product detected.

#### 16.1.2.4 *p*-Ethyl ester benzyl amine 682' in anhydrous THF

The attempted synthesis route is the same as in 16.1.2.2 (scheme 139).

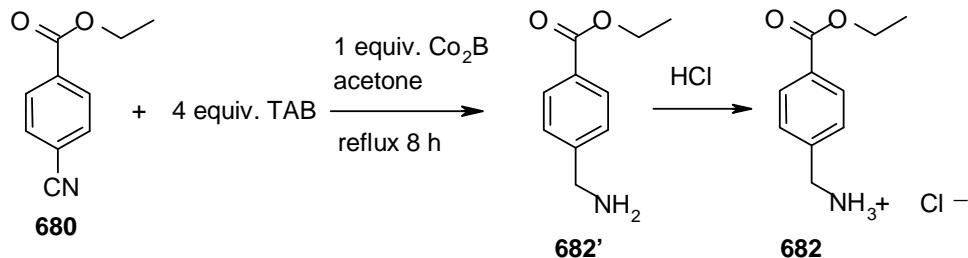

0.64 g (5.00 mmol) Co<sub>2</sub>B, 1.74 g (20.00 mmol) TAB and 0.88 g (5.00 mmol) ester **680** are ground to a powder and added to a flask containing 80 mL anhydrous THF. The mixture is refluxed in an oil bath with stirring for eight hours. The solution is evaporated with a rotatory evaporator. The product is extracted with 90 mL CHCl<sub>3</sub> and the solid removed by filtering.

Extraction with 2 M HCl. The solution is made slightly basic (pH 8) with 2 M NaOH. Some white solid is formed.

The solution is concentrated to one half using a rotatory evaporator and filtered with suction. All of the solid remains in the pores of the filter and the change in mass isn't registered by the scale.

50 mL CHCl<sub>3</sub> is added to the filtrate for possible extraction. After filtering the solution is evaporated with a rotatory evaporator. No solid remains in the flask.

### 16.1.2.5 *p*-Ethyl ester benzyl amine **682'** in acetone

Scheme 141. The synthesis of *p*-ethyl ester benzyl amine **682'** in acetone and its chloride salt **682**.

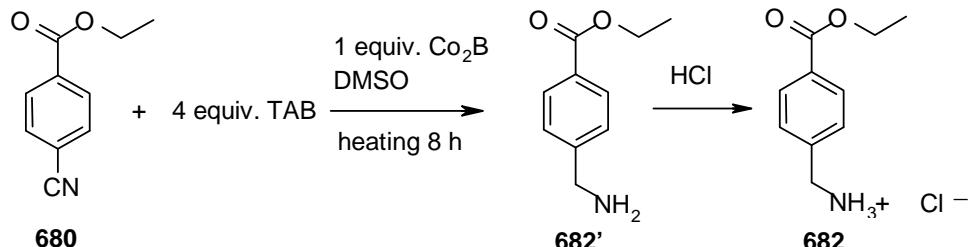

0.64 g (5.00 mmol)  $\text{Co}_2\text{B}$ , 1.74 g (20.02 mmol) TAB and 0.88 g (5.00 mmol) ester **680** are ground to a powder and added to a flask containing 80 mL acetone. The mixture is refluxed in an oil bath with stirring for eight hours. The solution is evaporated with a rotatory evaporator. A black syrup-like residue remains.

Extraction with 90 mL  $\text{CHCl}_3$  (the residue is dissolved), the solid is removed by filtering with suction (very slow). The solution is golden brown.

Extraction with 70 mL 2 M HCl. The  $\text{CHCl}_3$ -layer is coffee-colored, the HCl-layer golden brown.

The experiment is discontinued due to the fact that the formation of the desired product is highly unlikely.

### 16.1.2.6 *p*-Ethyl ester benzyl amine **682'** in DMSO

Scheme 142. The synthesis of *p*-ethyl ester benzyl amine **682'** in DMSO and its chloride salt **682**.

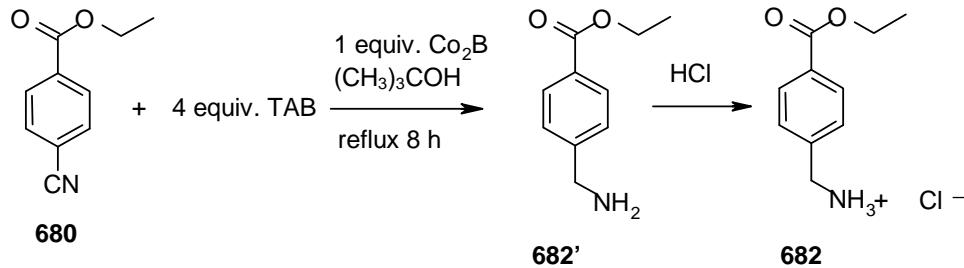

0.64 g (5.00 mmol) Co<sub>2</sub>B, 1.74 g (20.01 mmol) TAB and 0.88 g (5.01 mmol) ester **680** are ground to a powder and added to a flask containing 80 mL DMSO. The mixture is heated (95°C) in an oil bath with stirring for eight hours. The DMSO is removed by vacume distillation. The residue is a black and white powder.

Extraction with 90 mL CHCl<sub>3</sub> (most of the residue isn't dissolved), the solid is removed by filtering. The solution is turquoise.

Extraction with 2 M HCl. The CHCl<sub>3</sub>-layer turns yellowish and cloudy, the HCl-layer is pink.

The HCl solution is made slightly basic (pH 8) with 2M NaOH. The purple solid is removed by filtering. The yield is 0.19g. The presence of the desired product is highly unlikely.

#### 16.1.2.7 *p*-Ethyl ester benzyl amine **682'** in *tert*-butanol

Scheme 143. The synthesis of *p*-ethyl ester benzyl amine **682'** in *tert*-butanol and its chloride salt **682**.

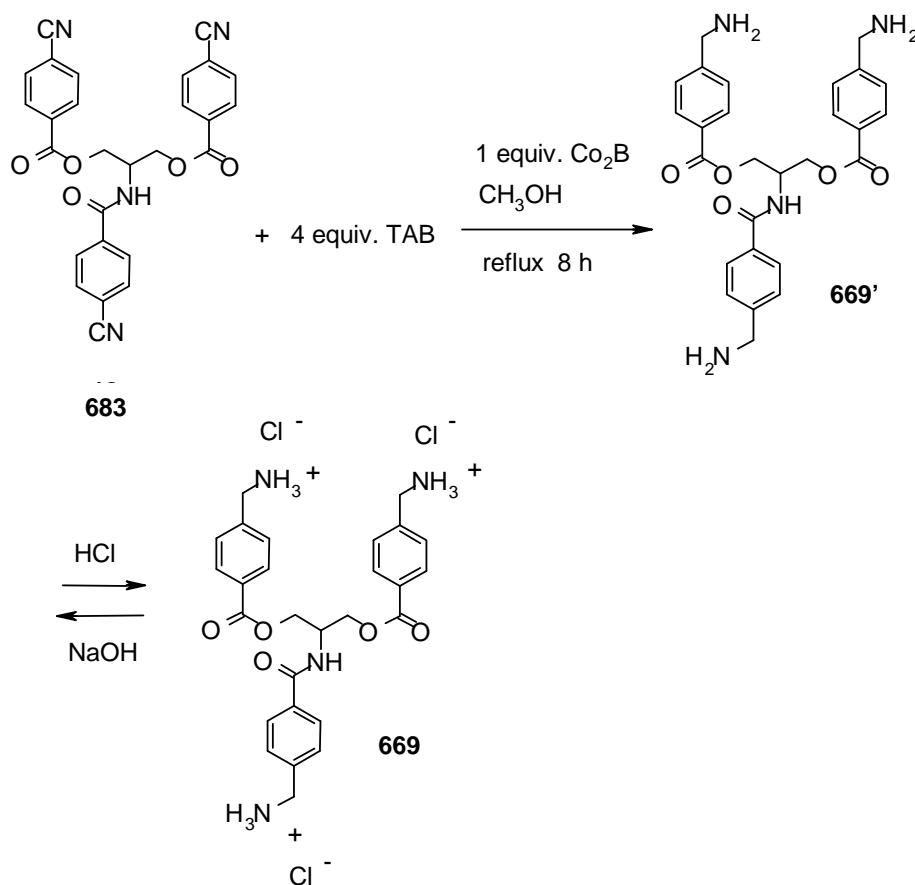

0.37 g (2.86 mmol) Co<sub>2</sub>B, 1.00 g (11.46 mmol) TAB and 0.51 g (2.91 mmol) ester **680** are ground to a powder and added to a flask containing 50 mL *tert*-butanol. The mixture is refluxed in an oil bath with stirring for eight hours. The solution is evaporated with a rotatory evaporator.

Extraction with 50 mL CHCl<sub>3</sub>. The solid is removed by filtering with suction after ½ h.

Extraction with 2 M HCl. The CHCl<sub>3</sub>-layer is cloudy, the HCl-layer clear.

The HCl solution is made slightly basic (pH 8) with 2M NaOH. A small amount of white solid is formed. The solution is allowed to evaporate overnight to a half. The solid is removed by filtering. The presence of the desired product is highly unlikely.

### 16.1.3 Target molecule **669** in methanol

Scheme 144. The attempted synthesis of triamine **669'** in methanol and its chloride salt, target molecule **669**.

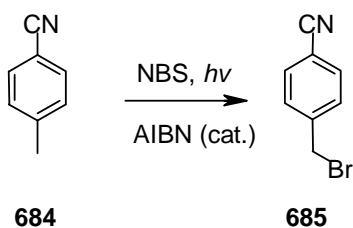

0.43 mmol (0.06 g)  $\text{Co}_2\text{B}$ , 1.68 mmol (0.15 g) TAB and 0.43 mmol (0.20 g) diester **683** are ground to a powder and added to a flask containing 20 mL  $\text{CH}_3\text{OH}$ . The mixture is refluxed in an oil bath with stirring for eight hours. The solution is evaporated with a rotatory evaporator.

Extraction with 20 mL  $\text{CHCl}_3$ . The solid is removed by filtering with suction after  $\frac{1}{2}$  h.  
Extraction with 6 mL 2 M HCl. Both the  $\text{CHCl}_3$ -layer and the HCl-layer are cloudy.

The HCl solution is made slightly basic (pH 8) with 2 M NaOH. The solution is allowed to evaporate overnight to a half. The solid is removed by filtering with suction. The presence of the desired product is highly unlikely.

## 16.2 The synthesis of a modified version **688** of target molecule **673**

### 16.2.1 4-Cyano benzyl bromide **685**

Scheme 145. The synthesis of 4-cyano benzyl bromide **685** in NBS.<sup>42</sup>

a) 20 mL CCl<sub>4</sub>, 1.01 g (8.61 mmol) *p*-tolunitrile **684** and 1.52 g (8.54 mmol) NBS in a two-necked flask are brought to a gentle reflux in an oil bath with stirring. The oil bath is removed and a 100 W light bulb aimed at the solution. Some AIBN is added quickly and the apparatus covered in tin foil. The refluxing stops. After three hours the white solution turns bright orange. The reaction is stopped after 4.5 h total. The solution has turned white. The solution is immediately filtered with suction and evaporated with a rotatory evaporator. The yield is 1.39 g.

<sup>1</sup>H NMR (CDCl<sub>3</sub>): δ = 8.00-7.96 (d, 1H), 7.85-7.80 (d, 1H), 7.67 (s, 1H), 7.63-7.59 (d, 2H), 7.55 (s, 1H), 7.50-7.47 (d, 2H), 7.27-7.25 (t, 1H), 6.62 (s, 1H), 4.48 (s, 2H), 2.42 (s, 1H), 1.72 (s, 1H) ppm.

<sup>13</sup>C NMR (CDCl<sub>3</sub>): δ = 146.07, 143.62, 142.78, 132.83, 132.51, 131.98, 129.81, 129.77, 129.65, 127.34, 118.27, 117.77, 113.49, 112.15, 109.27, 77.51, 77.21, 77.00, 76.49, 68.12, 38.66, 31.41, 25.09, 21.76 ppm.

b) The experiment is repeated using 40 mL CCl<sub>4</sub>, 3.00 g (25.62 mmol) *p*-tolunitrile and 5.01 g (28.17 mmol) NBS. The reaction is stopped after 3.5 h. The solution is immediately filtered with suction and evaporated with a rotatory evaporator.

40 mL CHCl<sub>3</sub> is added to dissolve the solid. The solution is washed with water, saturated NaHCO<sub>3</sub> and water, then evaporated with a rotatory evaporator. The yield is 4.97 g.

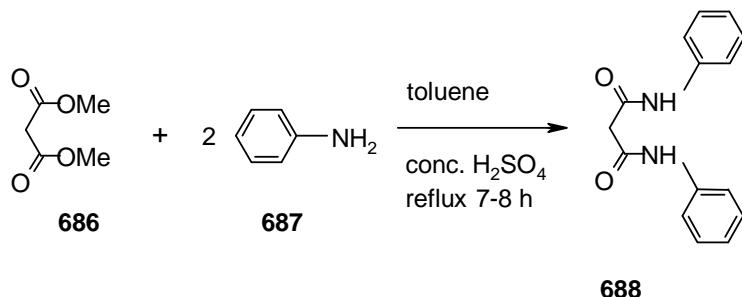

<sup>1</sup>H NMR (CDCl<sub>3</sub>): δ = 7.98 (s, 1H), 7.65-7.62 (d, 2H), 7.55 (s, 1H), 7.55-7.48 (d, 2H), 7.28-7.25 (t, 1H), 6.63 (s, 1H), 2.41 (s, 1H), 1.72 (s, 1H), 1.54 (s, 1H) ppm.

The solids obtained from the two experiments are combined and dissolved in 50 mL CHCl<sub>3</sub>. The solution is dried with Na<sub>2</sub>SO<sub>4</sub> and evaporated with a rotatory evaporator. 50 mL toluene is added to the flask which is heated to dissolve all of the solid. The solution is allowed to cool. No crystallization perceptible.

Half of the toluene is removed by distillation, still no crystallization perceptible. The solution is refrigerated overnight and the powdery white solid removed by filtering with suction. The yield is 2.26 g (11.53 mmol).

<sup>1</sup>H NMR (CDCl<sub>3</sub>): δ = 7.68 (s, 1H), 7.65-7.62 (d, 2H, 7.51-7.48 (d, 2H), 4.47 (s, 2H) ppm.

### 16.2.2 Malonyl dianilide **688**

Scheme 146. The synthesis of malonyl dianilide **688** in toluene.

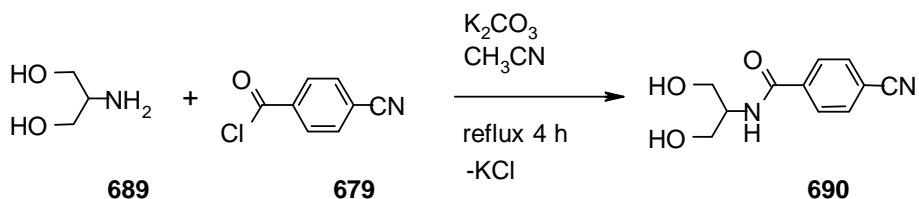

A mixture of 50 mL dry toluene, 1.56 g (11.81 mmol) dimethyl malonate **686**, 2.42 g (25.99 mmol) anilin **687** and 3 drops H<sub>2</sub>SO<sub>4</sub> in a flask is heated to 90°C for 8 h. White solid is formed almost instantly.

The cooled mixture is filtered with suction. The yield is 0.46 g. The solid won't dissolve in H<sub>2</sub>O, EtOH, MetOH, DMSO or acetone and only slightly in CHCl<sub>3</sub>.

The filtrate is washed with water and dried with Na<sub>2</sub>SO<sub>4</sub>. The toluene is removed by distillation. A dark brown viscous liquid with some solid remains in the flask. The yield is 2.26 g. No desired product detected.

### 16.3 The synthesis of a modified version 691 of target molecule 677

#### 16.3.1 *N*-(*p*-cyanobenzoyl)-2-amino-propan-1,3-diol 690

Scheme 147. The synthesis of **690** in CH<sub>3</sub>CN.

##### 16.3.1.1 Serinol 689, K<sub>2</sub>CO<sub>3</sub> and 4-cyanobenzoyl chloride 679 1:1:1

A mixture of 30 mL acetonitrile CH<sub>3</sub>CN, 0.49 g (5.33 mmol) serinol **689** and 0.74 g (5.35 mmol) K<sub>2</sub>CO<sub>3</sub> in a flask is heated with stirring in an oil bath. 0.86 g (5.35 mmol) 4-cyanobenzoyl chloride **679** in 20 mL acetonitrile is added slowly with a dropping funnel. The mixture is brought to a reflux for four hours.

The yellow solution is filtered and the filtrate evaporated with a rotatory evaporator. The yield is 1.12g (a syrup-like residue). No desired product detected.

##### 16.3.1.2 Serinol 689, K<sub>2</sub>CO<sub>3</sub> and 4-cyanobenzoyl chloride 679 1:3:1, no heating

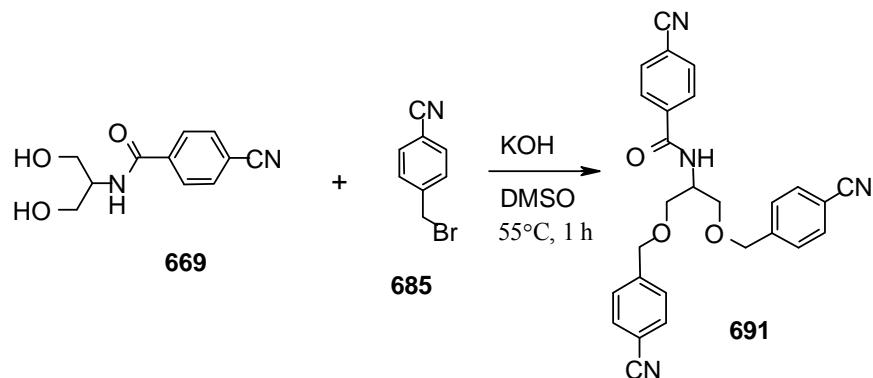

A mixture of 20 mL acetonitrile CH<sub>3</sub>CN, 0.33 g (3.63 mmol) serinol **689** and 1.50g (10.87 mmol) K<sub>2</sub>CO<sub>3</sub> in a flask is heated in an oil bath. 0.60 g (3.63 mmol) 4-cyanobenzoyl chloride **679** in 30 mL acetonitrile is added slowly with a dropping funnel. The mixture is stirred for 6½ h.

The white solution is filtered and the filtrate evaporated with a rotatory evaporator. The yield is 0.74 g (3.36 mmol, yellowish solid).

<sup>1</sup>H NMR (CD<sub>3</sub>OD): δ = 8.01-7.97 (d, 2H), 7.85-7.81 (d, 2H), 4.19-4.15 (m, 1H), 3.75-3.72 (d, 4H), 3.32-3.29 (m, 2H) ppm.

### 16.3.2 *N* -[2-(1,3-*p*-cyanobenzylxy)]-*p*-cyanobenzoyl amine **691**

The synthesis was attempted by way of alkylation of alcohols with an alkyl halide<sup>43</sup>.

Scheme 148. The synthesis of **691** in DMSO.

#### 16.3.2.1 Diol **690**, 4-cyanobenzyl bromide **685** and KOH 1:2:4 in acetone

0.32 g (5.65 mmol) ground KOH and 3 mL acetone are stirred in a flask. KOH is partly dissolved. 0.30 g (1.36 mmol) diol **690** and 0.53 g (2.72 mmol) 4-cyanobenzyl bromide **685** are added. The mixture is stirred at 55°C in a water bath for one hour, turning from yellow to brown. The acetone is removed with a rotatory evaporator.

50 mL water is added to the brown viscous residue. After stirring for ½ h the brown residue is partly dissolved. Extraction with 60 mL CH<sub>2</sub>Cl<sub>2</sub>, the residue is completely dissolved. The solution is washed with water, dried with Na<sub>2</sub>SO<sub>4</sub> and evaporated with a rotatory evaporator. The yield is 0.51 g (a very viscous yellow liquid). No desired product detected.

### 16.3.2.2 Diol **690**, 4-cyanobenzyl bromide **685** and KOH 1:4:8 in DMSO

0.61 g (10.90 mmol) ground KOH and 3 mL DMSO are stirred in a flask. 0.30 g (1.36 mmol) diol **690** and 1.07 g (5.45 mmol) 4-cyanobenzyl bromide **685** are added. The mixture is stirred at 55°C in a water bath for one hour, turning from yellow to brown, then poured into 30 mL water. A gum-like residue remains on the magnet, the mixture turns yellow.

Extraction with 90 mL CH<sub>2</sub>Cl<sub>2</sub>. The solution is washed with water, dried with Na<sub>2</sub>SO<sub>4</sub> and evaporated with a rotatory evaporator, leaving a yellow residue. The yield is 0.14 g. No desired product detected.

## 17 Summary

The aim was to synthesize a potential inhibitor for the integrin  $\alpha_{II}\beta_1$ . Twelve target molecules were designed. The plan was to try to synthesize as many of the target molecules as possible by constructing a neutral molecule of smaller molecules and then reducing it. Due to the limited time the syntheses of only molecule **669** and modified versions of molecules **673** and **677** were attempted.

The starting molecule 4-cyanobenzoyl ethyl ester **680** was synthesized successfully.

It was attempted to reduce the cyano group of the small molecule **680** (4-cyanobenzoyl ethyl ester) in order to see whether the ester bond would tolerate the conditions without breaking. The synthesis of *p*-ethyl ester benzyl amine **682'** was unsuccessfully attempted in anhydrous THF, 1,4-dioxane, acetone, DMSO and *tert*-butanol. A suitable solvent wasn't found and only mixtures of unwanted products were obtained. Due to the diminishing time left, syntheses of target molecules were started.

The synthesis of target molecule **669** failed due to the breaking up of the starting molecule **683**.

The synthesis of 4-cyano benzyl bromide **685**, a "building block" for a modified version **688** of target molecule **673**, was successful but the synthesis of the other "building block", malonyl dianilide **688**, failed due to unwanted bonding.

The synthesis of diol **690**, a "building block" for a modified version **691** of target molecule **677**, was successful after increasing the relative amount of  $K_2CO_3$  and conducting the synthesis without heating. However, the synthesis of molecule **691** alternately in acetone and DMSO failed due to unwanted bonding.

## Reagents and equipment

Table 34: The reagents used in the syntheses.

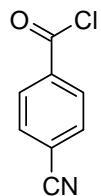

Reagent	Supplier	Purity
SOCl <sub>2</sub>	Riedel-de Haën	≥ 98%
EtOH	Primalco	99.5%
4-cyanobenzoic acid	Aldrich	appr. 50% (orig. 98%)
Co <sub>2</sub> B	K. Nättilä	
TAB	Aldrich	97%
CH <sub>3</sub> OH	Riedel-de Haën	99.8%
CHCl <sub>3</sub>	Riedel-de Haën	99.0-99.4%
HCl		2M
NaOH		2M
Na <sub>2</sub> SO <sub>4</sub>	Merck	≥ 99%
HCl	Riedel-de Haën	≥ 37%
THF		
1,4-dioxane		
CHCl <sub>3</sub>	Riedel-de Haën	99.8%
acetone	Riedel-de Haën	p.a.
DMSO	Rathburn Chemicals LTD	HPLC grade
(CH <sub>3</sub> ) <sub>3</sub> COH	Merck	p.a.
<i>p</i> -tolunitrile	Aldrich	98%
CCl <sub>4</sub>	Merck	≥ 99.8%
NBS	Riedel-de Haën	98%
AIBN	Merck	
toluene		
dimethyl malonate	Aldrich	98%
anilin	Merck	p.a.
2-amino-1,3-propandiol (serinol)	Aldrich	98%
K <sub>2</sub> CO <sub>3</sub>		
CH <sub>3</sub> CN	Mallinckrodt	HPLC grade

The equipment used for analyzing the products of the syntheses:

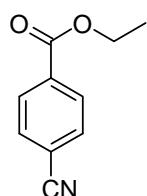

NMR spectrometers: Bruker Avance DPX 250 and Bruker Avance DRX 500.

MS spectrometer: VG AutoSpec HRMS spectrometer.

## Appendices

Appendix 1:  $^1\text{H}$  NMR and  $^{13}\text{C}$  spectra for **679**.

Appendix 2:  $^1\text{H}$  NMR and  $^{13}\text{C}$  spectra for **680**.

Appendix 3: MS spectra for attempted synthesis of **681'**.

Appendix 4:  $^1\text{H}$  NMR and MS spectra for attempted synthesis of **681**.

Appendix 5:  $^1\text{H}$  NMR spectra for attempted synthesis of **682**.

Appendix 6:  $^1\text{H}$  NMR spectrum for **680**.

Appendix 7:  $^1\text{H}$  NMR spectrum for attempted synthesis of **682'**.

Appendix 8:  $^1\text{H}$  NMR spectrum for attempted synthesis of **669'**.

Appendix 9:  $^1\text{H}$  NMR and  $^{13}\text{C}$  spectra for **685** a).

Appendix 10:  $^1\text{H}$  NMR spectrum for **685** b).

Appendix 11:  $^1\text{H}$  NMR spectrum for **685** (combined).

Appendix 12:  $^1\text{H}$  NMR spectrum for attempted synthesis of **688**

Appendix 13:  $^1\text{H}$  NMR spectrum for attempted synthesis of **688** (filtrate).

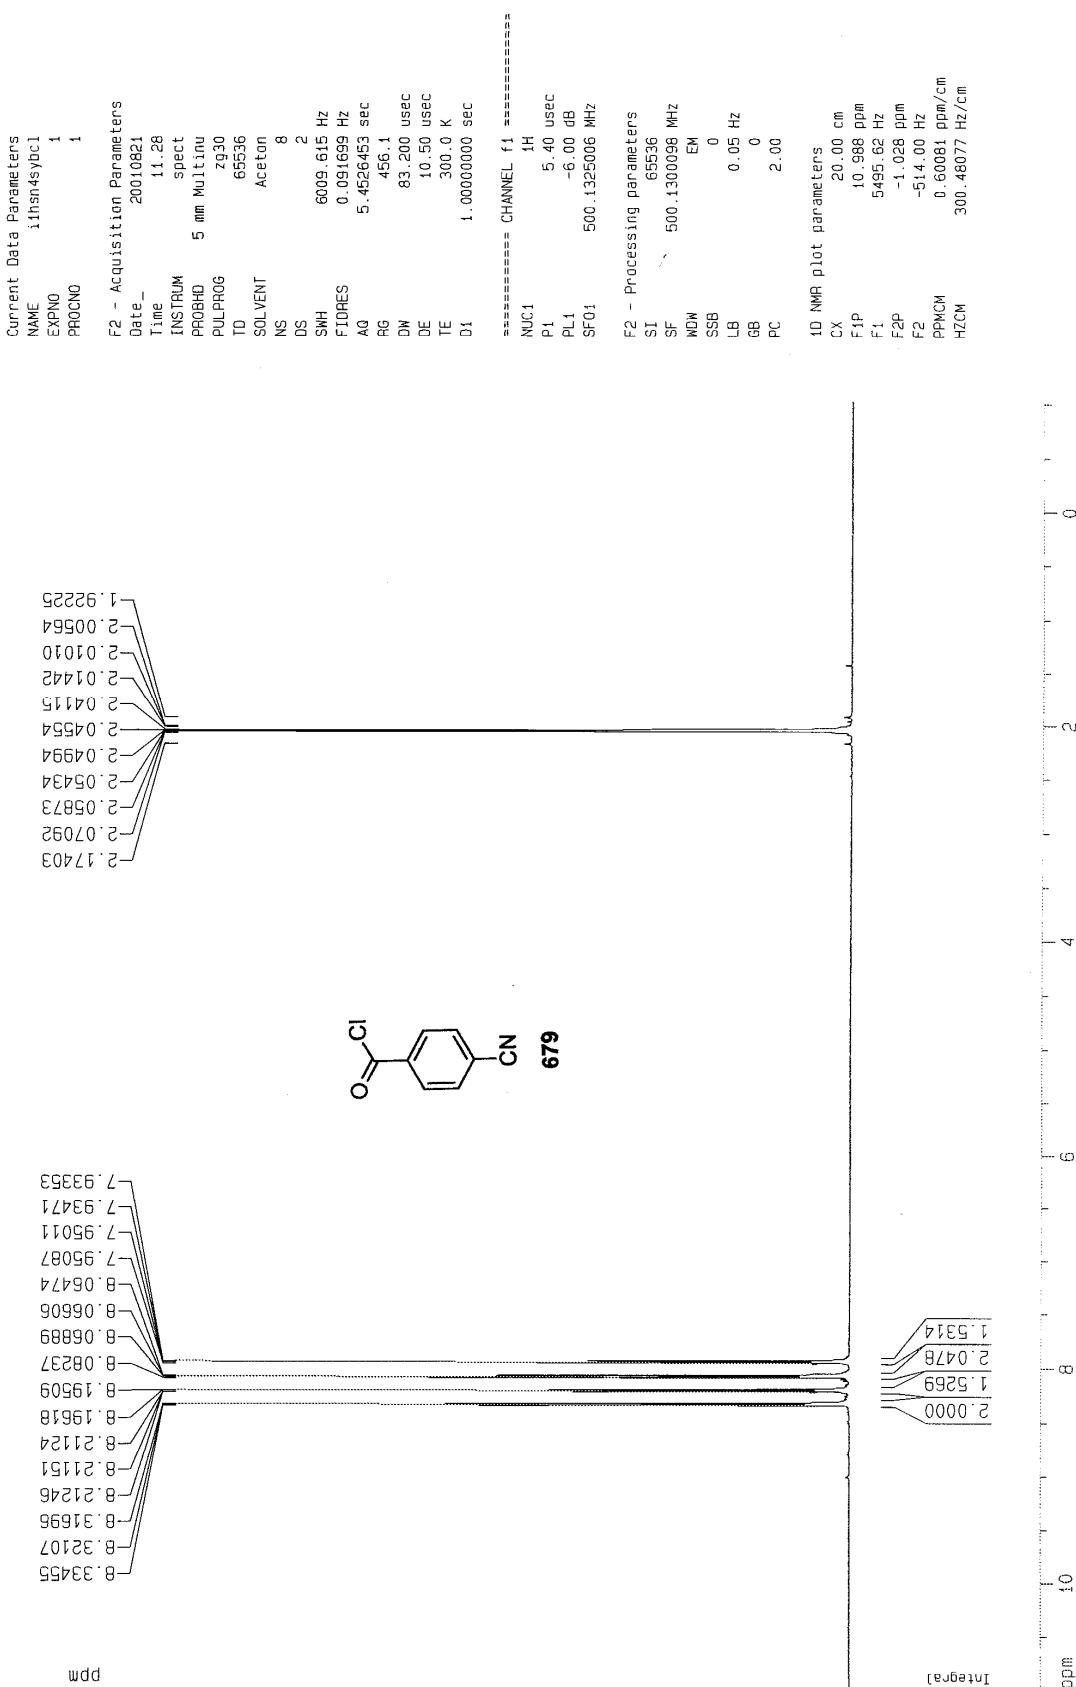

Appendix 14:  $^1\text{H}$  NMR spectrum for attempted synthesis of **690** (16.2.3.1).

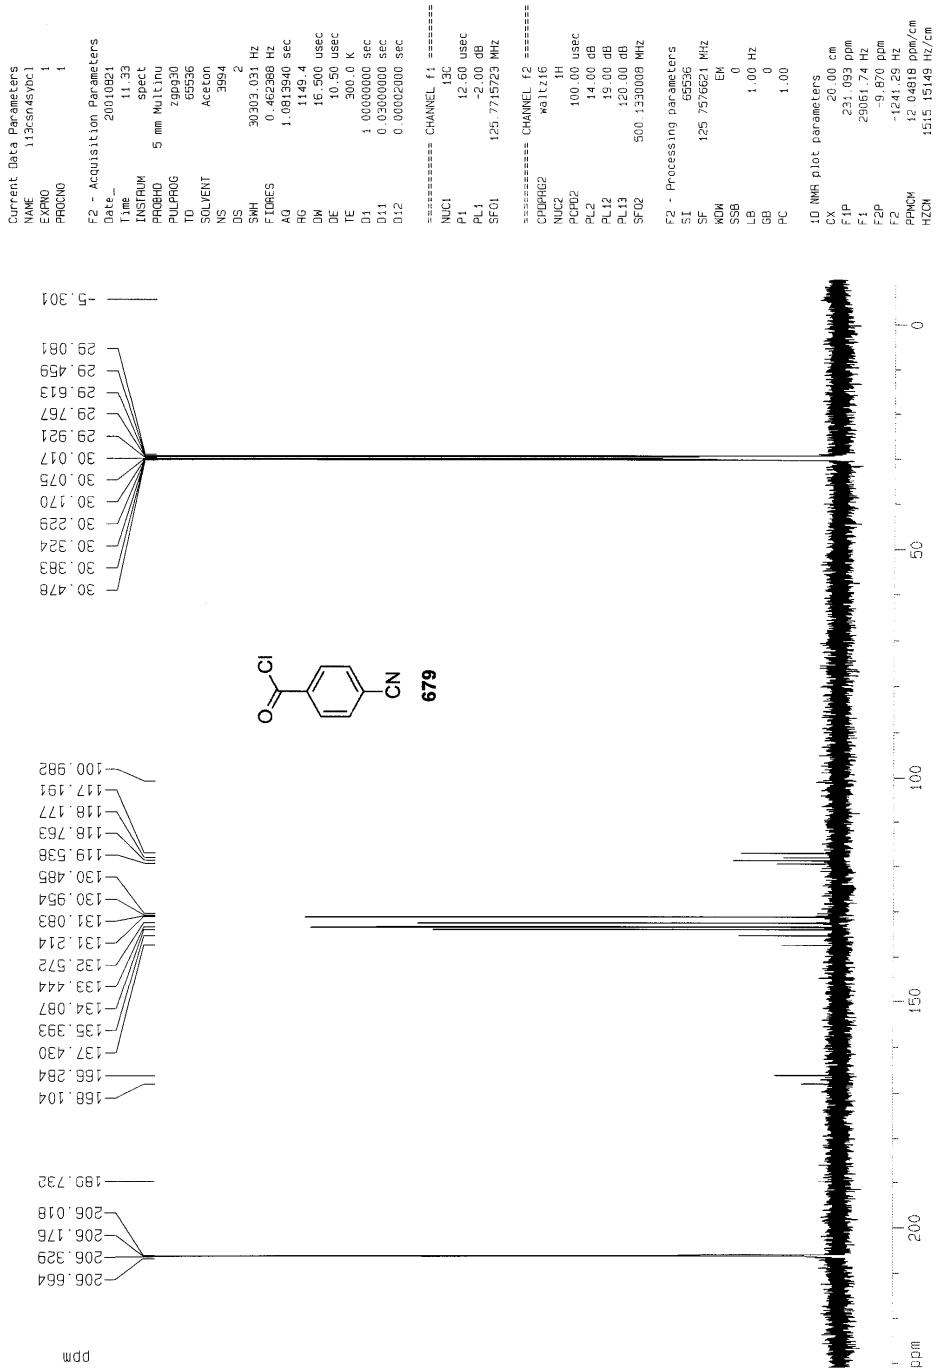

Appendix 15:  $^1\text{H}$  NMR spectrum for **690** (16.2.3.2).

Appendix 16:  $^1\text{H}$  NMR spectrum for attempted synthesis of **691** (16.2.4.1).

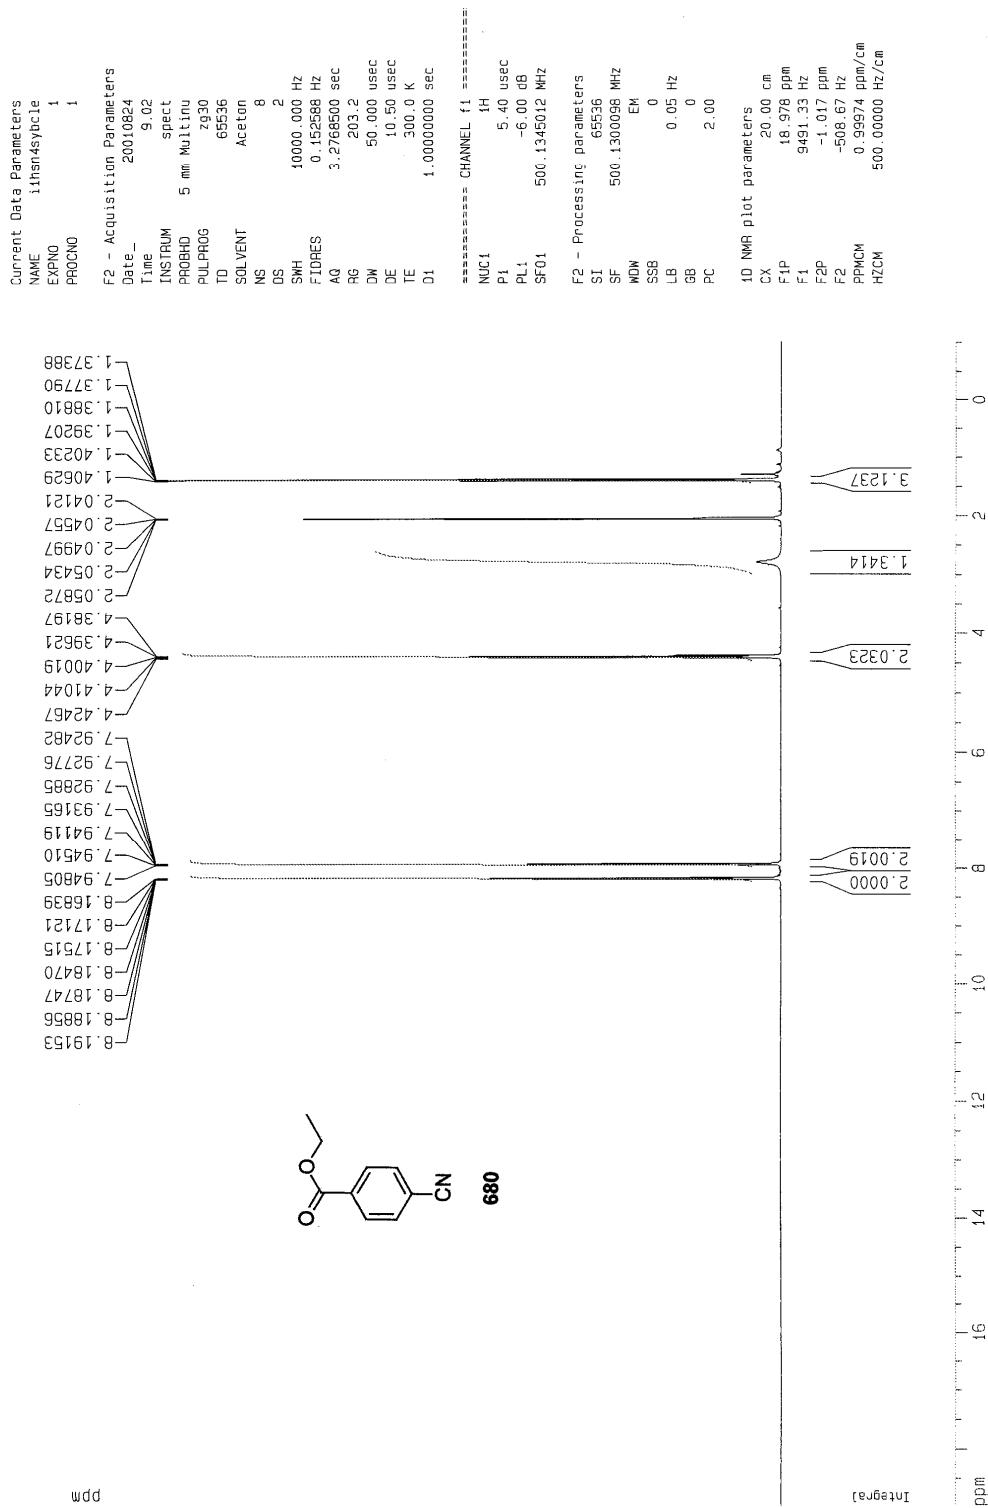

Appendix 17:  $^1\text{H}$  NMR spectrum for attempted synthesis of **691** (16.2.4.2).

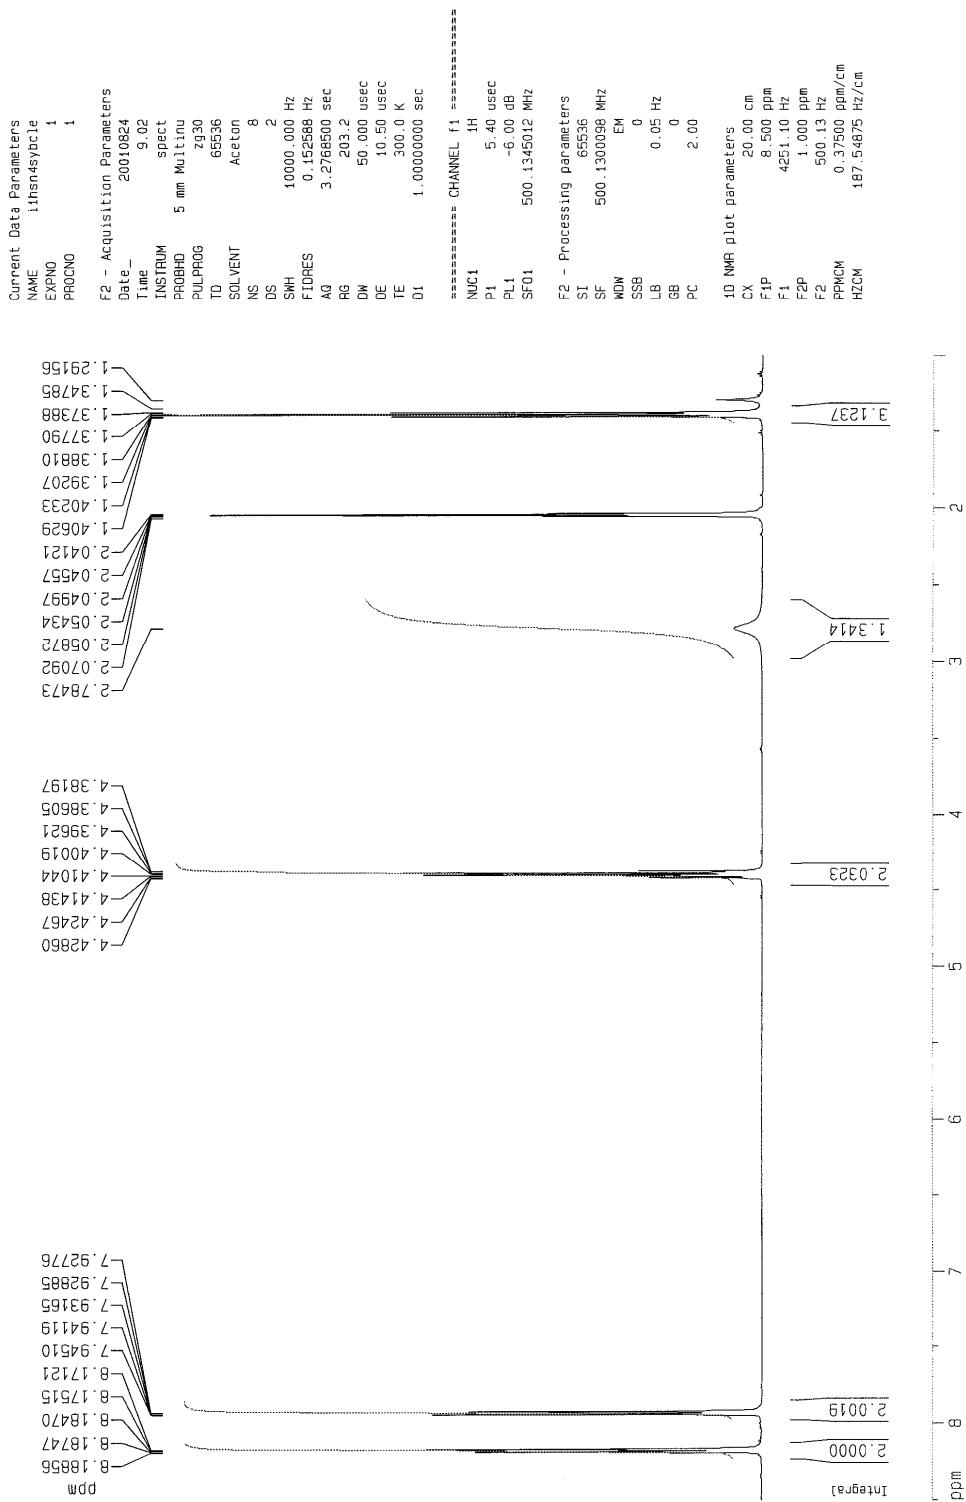

**APPENDIX 1:  $^1\text{H}$  NMR and  $^{13}\text{C}$  spectra for 679.**

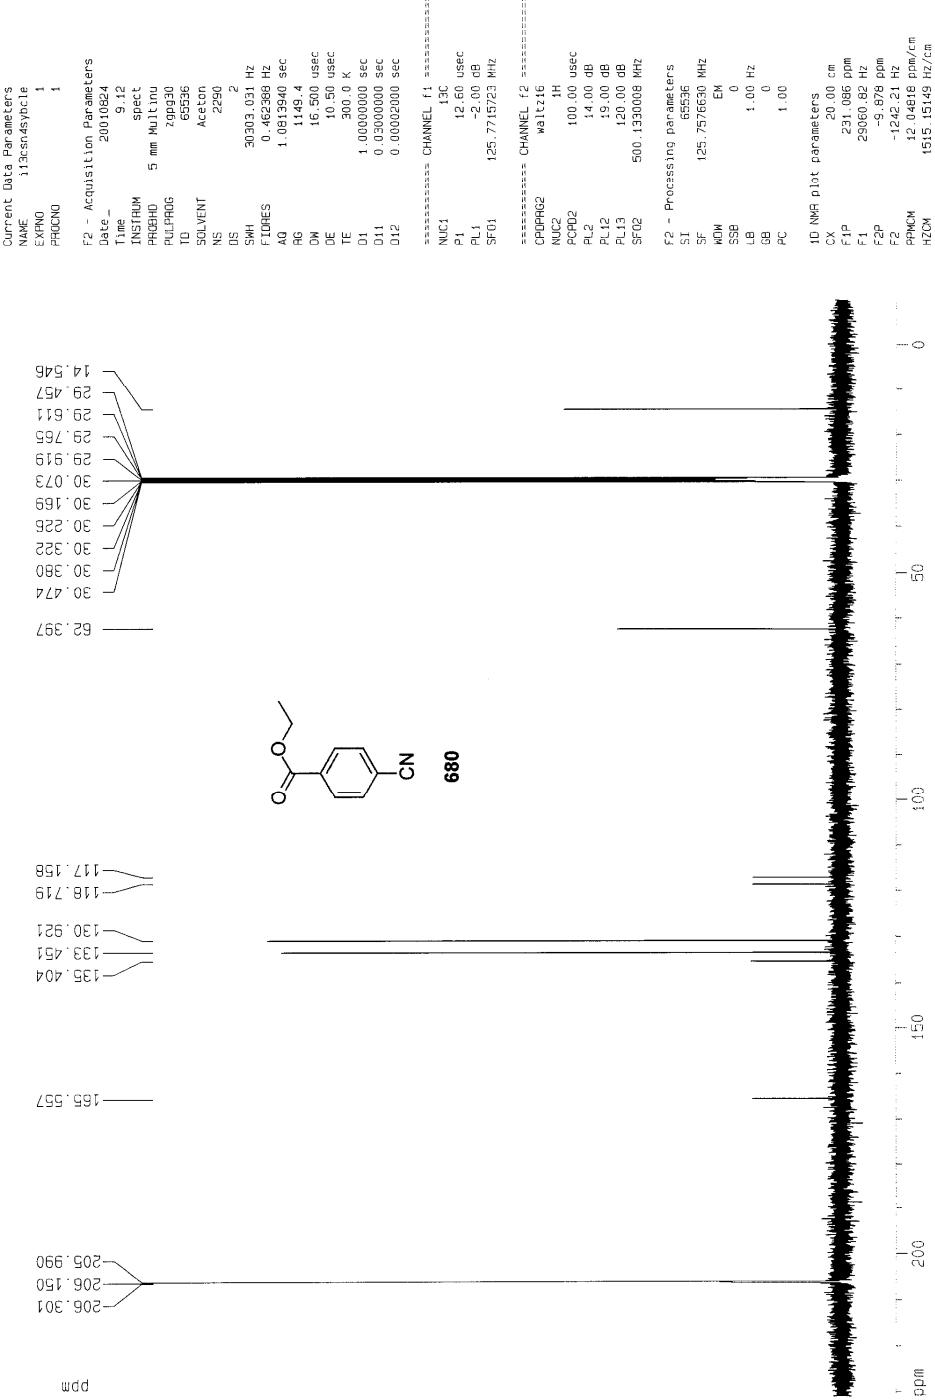

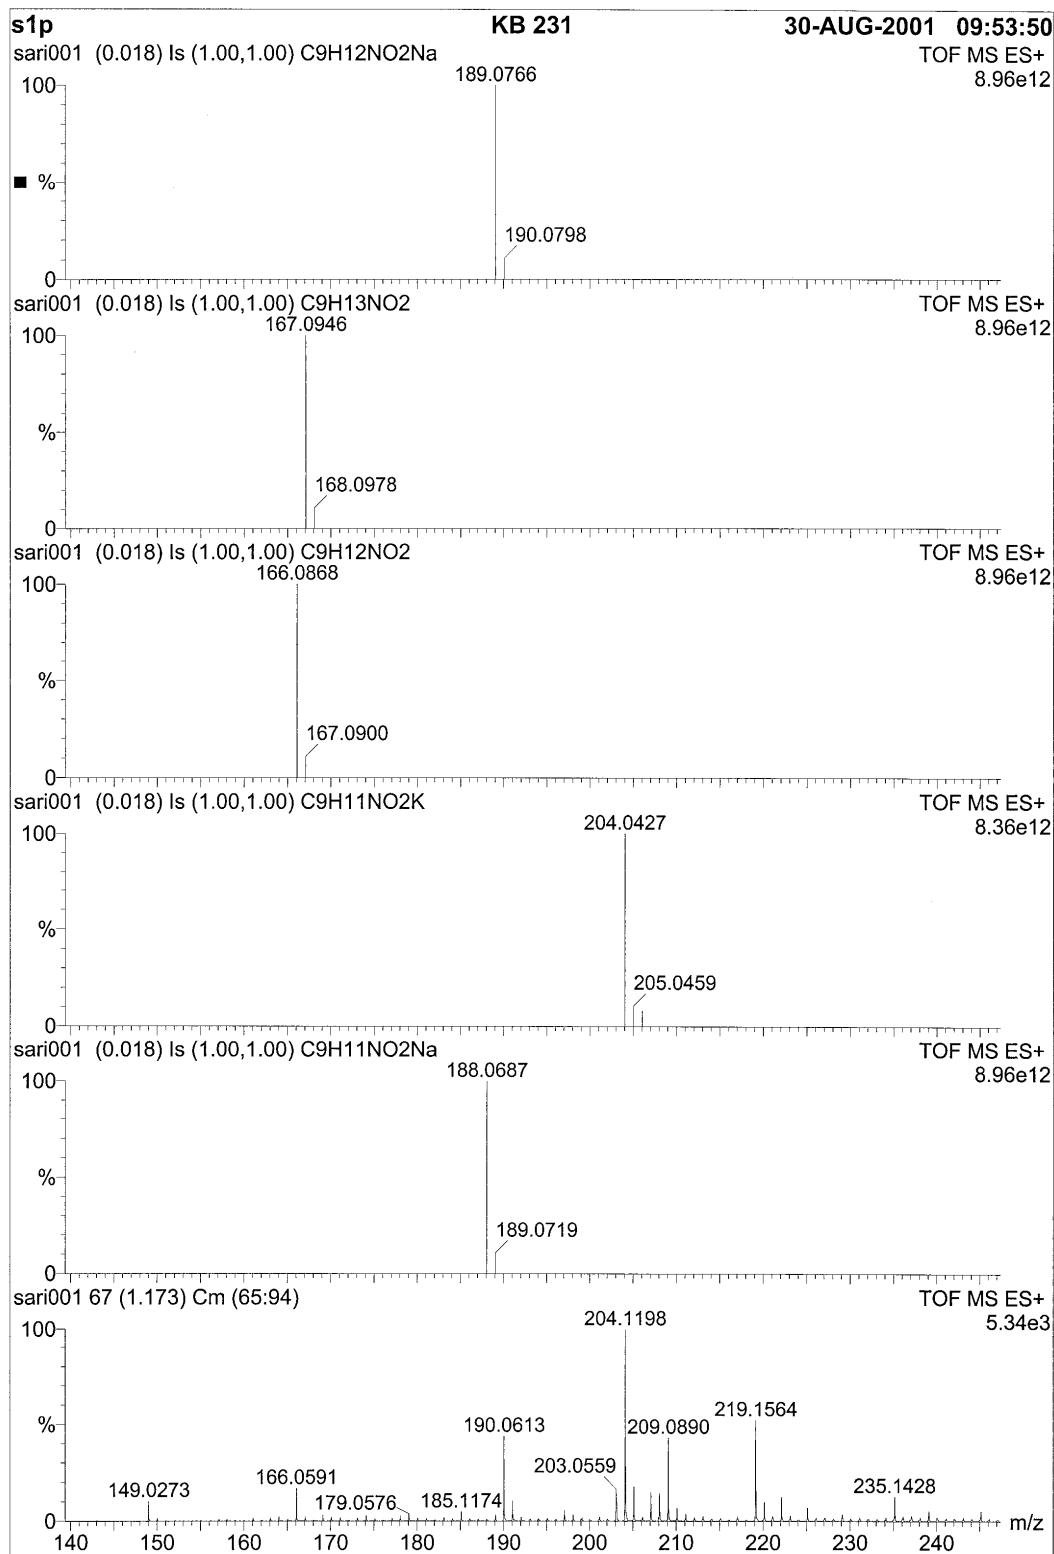

**APPENDIX 2:  $^1\text{H}$  NMR and  $^{13}\text{C}$  spectra for **680**.**

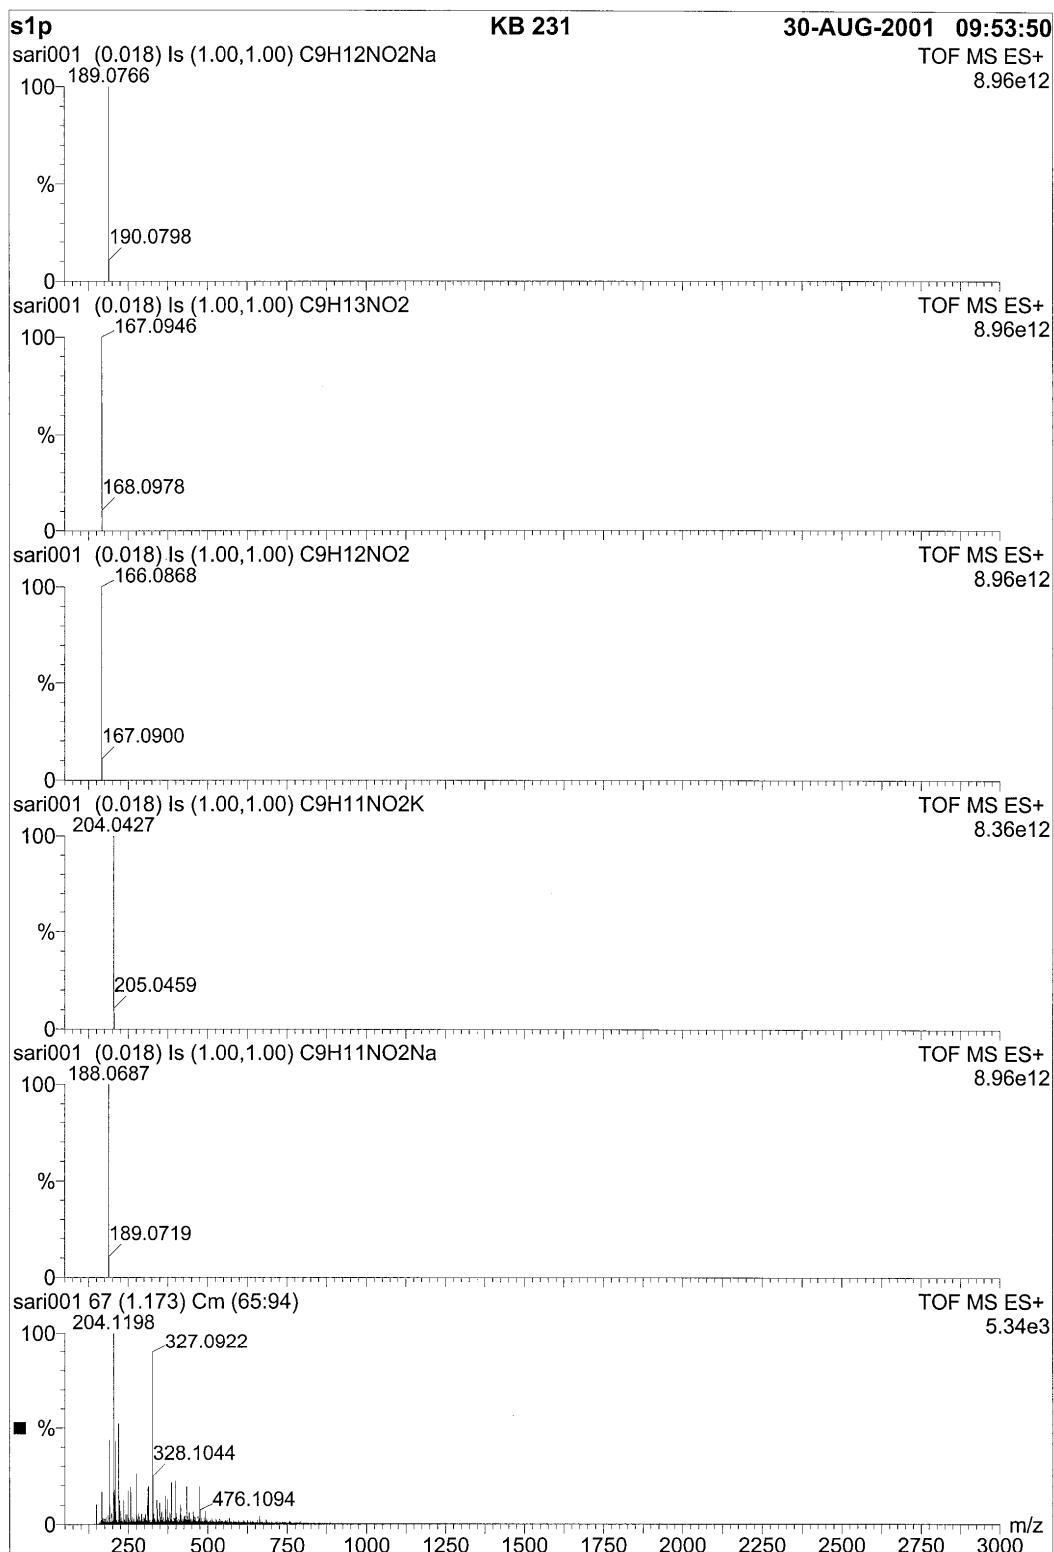

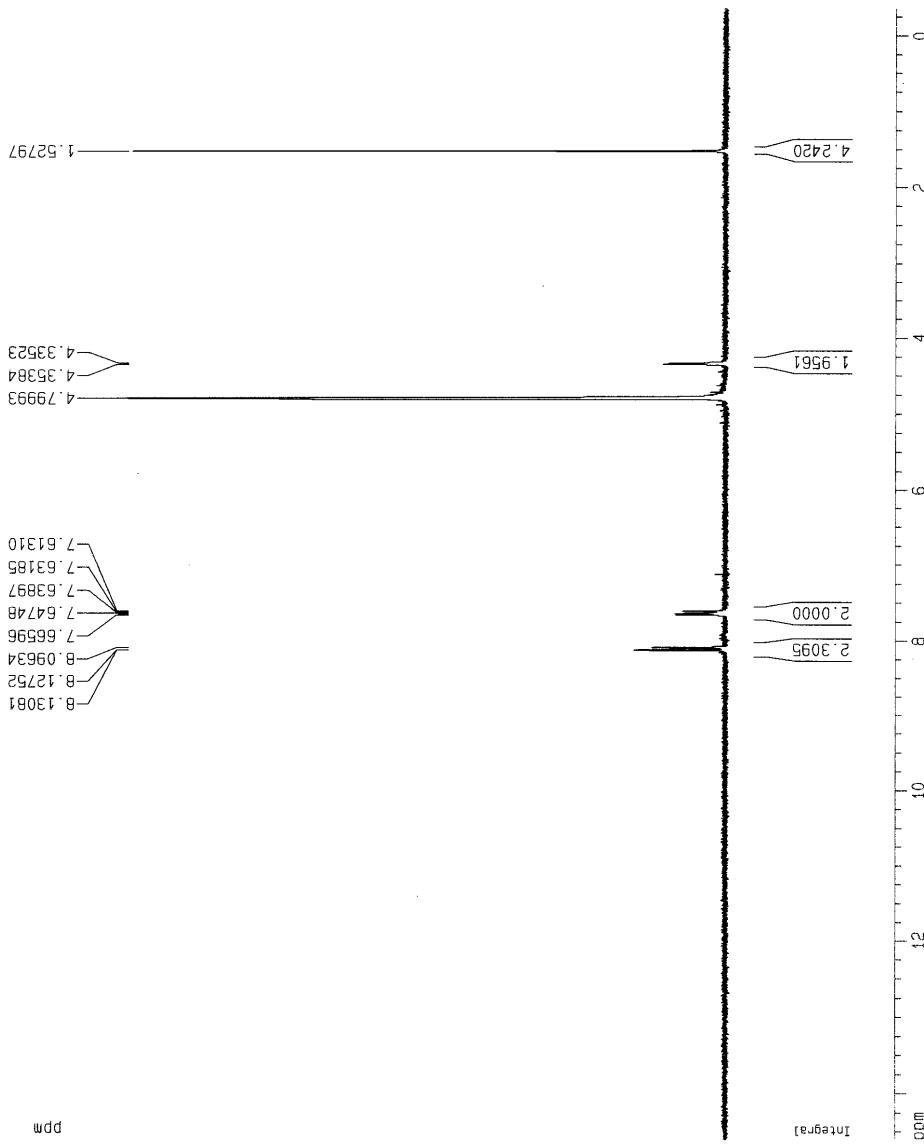

**APPENDIX 3: MS spectra for attempted synthesis of **681'**.**

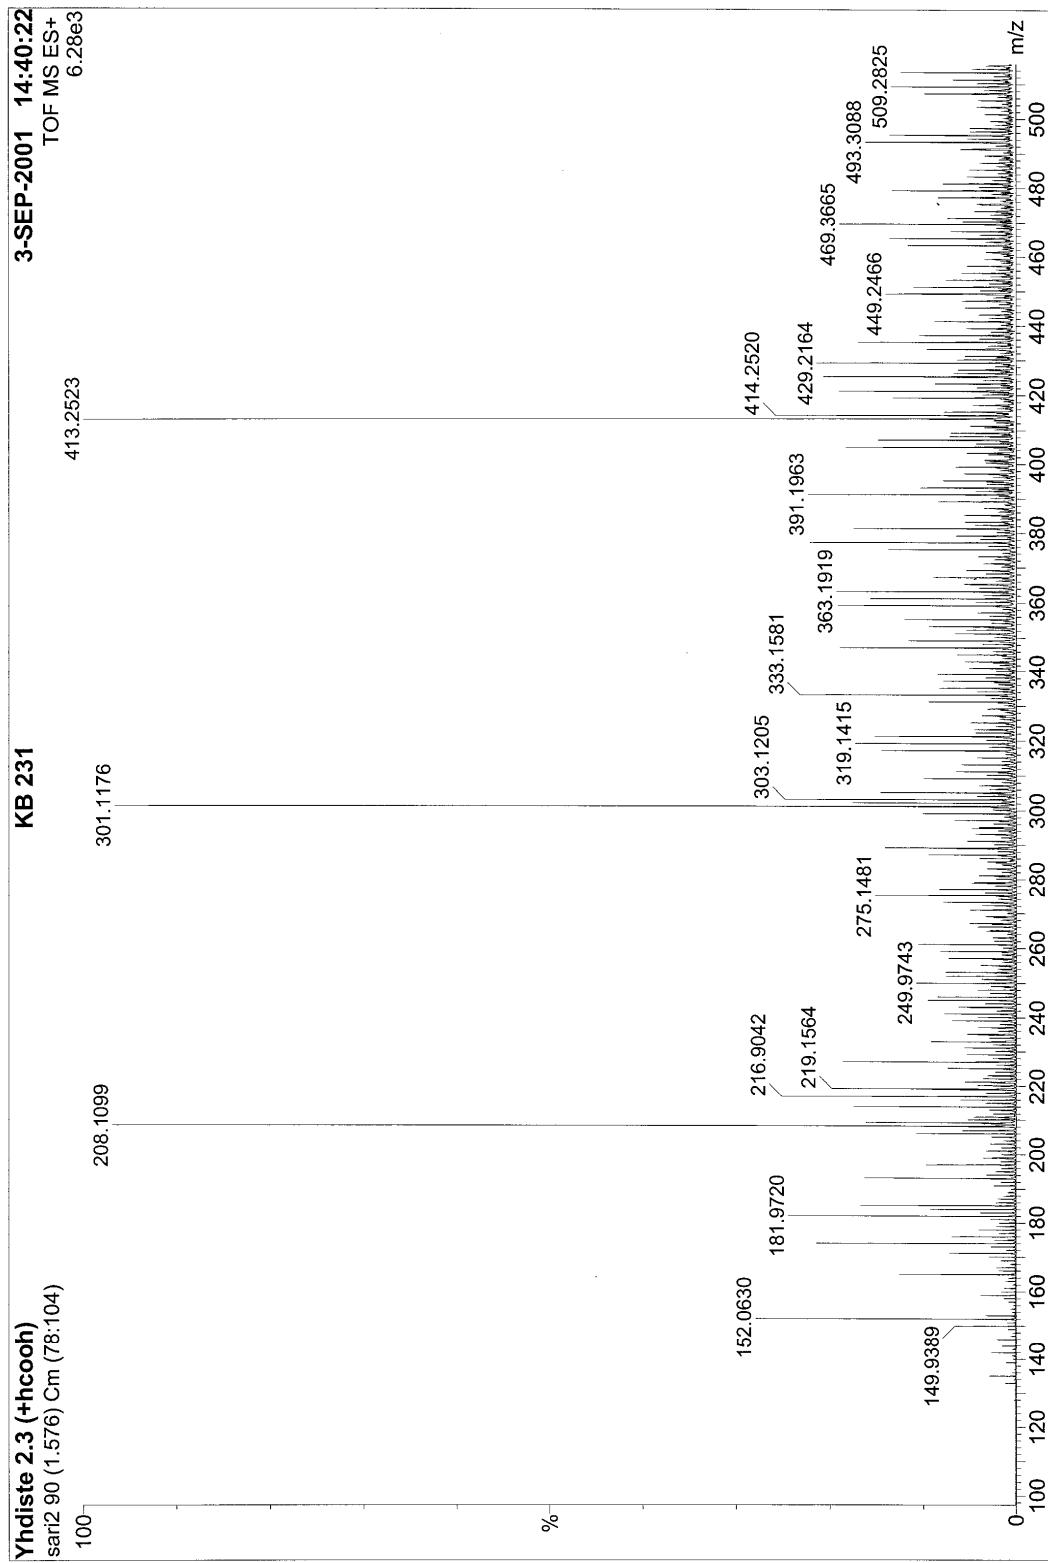

**APPENDIX 4:**  $^1\text{H}$  NMR and MS spectra for attempted synthesis of **681**.
