

Improving Information Access by Genre Categories

Luanne Freund & Airi Salminen

Faculty of Information Studies
Research Day
March 30, 2007

What's in a genre?

Approach: functional - communication acts

“genres are how things get done, when language is used to accomplish them (Martin, 1985)”

“a distinctive type of communicative action, characterized by a socially recognized communicative purpose and common aspects of form” (Orlikowski & Yates, 1994)”

Defined by: purpose, content & form

Focus: digital genre in organizational frameworks

Making use of genre

Characteristics

- Non-topical document feature
- Context-carrier
- Visual cue

Applications

- Genre analysis as “lens” to study organizations
- Related to work tasks and work process - IR matching and ranking
- Orthogonal to topic - useful for clustering results
- Structure - support summarization and information extraction

Case 1:

IBM software engineering genres

Relationship between work tasks and genres?

- **Genre Taxonomy**

- bottom-up taxonomy of 16 genres
- “fuzzy” - overlapping categories
- covers ~ 75% of documentary info sources

- **Metadata Analysis**

- Relationships between task and genre tags
- Underlying factors

Case 2: The Finnish Parliament

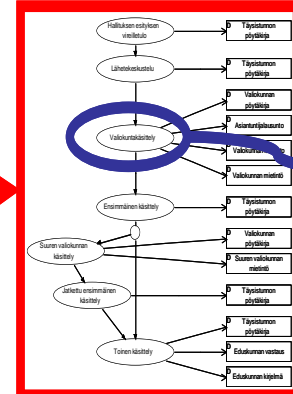

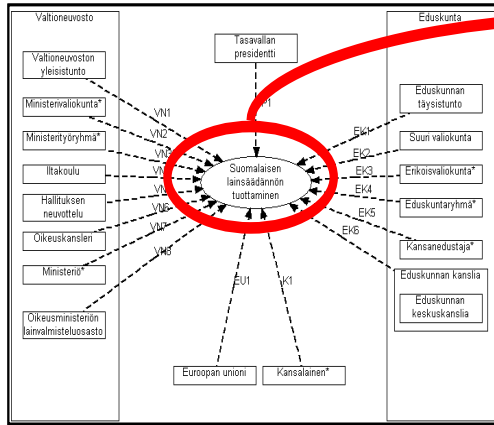

By the RASKE analysis methods we have analyzed

- inter-organizational and intra-organizational work processes in the legislative work
- organizations and people as actors in the processes
- documents and their metadata
- systems in the processes
- needs of organizations and people
- types of metadata

The analysis has provided

- organizational framework model
- document-relationship diagrams
- various process models
- document-actor matrixes
- role models
- metadata graphs

Results from the RASKE projects

- Information about business processes provides important contextual metadata.
- The contextual metadata is useful when accessing information from documents created in the processes.
- Contextual metadata can be provided in user interfaces, for example, by graphical models.
- Users find graphical models useful but implementation is difficult.

Yates and Orlikowski (2002) suggested analyzing genres and genre systems by six questions: Why, What, Who, When, Where, How (5W1H).

- A business process as communicative and collaborative action can be regarded as a genre system.
- Would 5W1H analysis of a business process provide a genre taxonomy useful in information retrieval?
- How to study the usefulness?
- Comparison of the software engineering process and legislative process: What are the similarities? What are the differences?
