COMPUTATIONAL MECHANICS IN FINLAND

PEKKA NEITTAANMÄKI

University of Jyväskylä, Department of Mathematics, Seminaarinkatu 15, 40100 Jyväskylä, Finland

Finland is known as a land of ice and snow. Thus good knowledge of arctic technology is very important for us. When constructing in arctic conditions, unusually large stresses are often caused by large temperature variations and by ice and snow loads.

The analysis in fracture mechanics was first developed mainly because of the safety analysis required in nuclear power plants, but later the methods were applied increasingly in other fields of industry as well.

The departments at the technical universities have pioneered the research and the training of specialists in steel structures and welding technology in Finland. Because of robot and laser technology the latter field is of governing interest.

In this description some of today's activities in the sphere of computational mechanics in Finland have been collected. It consists of a short list of research interests and projects, finite element and computer-aided engineering software at five universities and at the technical research centre of the state. In the section on recent research reports a list of some recent publications from these institutions is given.

At *Helsinki University of Technology* the research activity in computational mechanics concentrates mainly on four departments. The research topics at the *Department of Civil Engineering* (M. J. Mikkola) are

- (a) Non-linear problems of structural mechanics:
 - (i) geometrical and material non-linearities
 - (ii) static and transient dynamic problems
 - (iii) beams, frames, plates and shells
 - (iv) metal and reinforced concrete structures.
- (b) Constitutive equations and concrete based on continuous damage theory.
- (c) Numerical analysis of box girders.
- (d) Structural analysis of fire-exposed steel structures.

The research projects at the *Department of Mechanics* (E.-M. Salonen) are

- (a) Applications of the finite element method:
 - (i) free surface flows in hydraulics
 - (ii) plate bending with non-conforming elements.
- (b) Non-linear phenomena and chaos:
 - (i) chaos in an impact oscillator
 - (ii) chaos in Duffing's oscillator.

At the *Institute of Strength of Materials* (E. Pennala) problems regarding the state of stress and deformations of structures of various materials are investigated by means of mathematical models, finite element methods and experiments. Research is carried out in the following areas:

- (a) Fatigue of materials and structures.
- (b) Basic strength properties of Finnish structural plywoods.
- (c) Vibrations of structures (theoretically: FEM; experimentally: single and multiple exciter techniques).

At the *Institute of Mathematics* (J. Pitkäranta) the research in computational mechanics is devoted to the theoretical aspects of the finite element method, especially to

- (a) Mixed finite element methods.
- (b) Multigrid methods.

The commercial FEM computer programs used at Helsinki University of Technology are ADINA, ADINAT, PAFEC, PIGS and SAPIV. CAE software: CADAM, CATIA, SUPERTAB and SUPERB. Moreover, several programs have been developed for special methods of FEM and especially in CAE.

At *Tampere University of Technology* the research related to computational mechanics is carried out in the *Institution of Applied Mechanics* (A. Pramila). The research projects are

- (a) Surface and curve creation methods for CAD using variational principles and FEM. Applications in the ship, boat and aeroplane industries.
- (b) Vibration and stability of axially moving material. Applications to sheet flutter control in paper mills and printing machines.
- (c) Statistics of thin shells of revolution employing FEM based on analytical solutions. Applications to pressure vessels and storage tanks etc.
- (d) Force methods in the analysis of geometrically non-linear structures. Applications to bridges.
- (e) Multicriterion optimization of structures. Applications to every kind of load carrying structure.
- (f) Mechanics of curved beams. Applications to stairs, bridges etc.
- (g) Unilateral contact problems. Applications to railway wheels etc.
- (h) Numerical methods in fracture mechanics.

The FEM programs used are: ABACUS, ADINA, ANSYS, GAFEP, SAP VI, SAP VII, and STAFRA. CAE-systems: Gen Rad 2515, Computervisions and CADAM.

At the *University of Oulu* the research in computational mechanics is taking place mainly at two departments. At the *Laboratory of Technical Mechanics* (M. Määttänen) the research projects are

- (a) Ice-structure dynamic interaction.
- (b) Ice forces against offshore structures.
- (c) Mechanical vibrations, e.g. applied to paper machines.
- (d) Large displacement material non-linear (including viscosity) FEM analysis.
- (e) Post-buckling behaviour of plates on elastic foundations.

At the *Department of Mathematics* (J. Saranen) theoretical aspects of FEM, the boundary element method and the collocation method are studied. The research projects are

- (a) FEM solution of compressible and incompressible flows.

- (b) BEM solution of non-smooth potentials.
- (c) Fast solvers of BEM.
- (d) FEM analysis of high-speed elevator vibration.

The FEM/CAE programs used are ADINA, FINEL, NASTRAN, NONSAP, STRUOL, and CAODS 4. The Department of Mathematics uses mainly its own program development.

Lappeenranta University of Technology is the youngest technical university in Finland (opened in 1969). In computational mechanics the research is being done at the *Department of Mechanical Engineering* (H. Martikka and M. Suviolahti). The main research interests are

- (a) In design of machine elements:
 - (i) CAD
 - (ii) optimization of machine elements and mechanisms.
- (b) Steel structures:
 - (i) plastic capacity of joints
 - (ii) weld fatigue, residual stresses due to welding
 - (iii) elastic-plastic fracture mechanics
 - (iv) optimization of structures.
- (c) Workshop engineering research.
- (d) Practical applications of photoelasticity.
- (e) Secondary stresses of structures.
- (f) FE software for microcomputers.
- (g) Thermal stresses in continuous casting of steel.

The FEM programs used are ADINA, ANSYS, NASTRAN, SAP IV, SAP VI, and TWODEPEP. CAE software: I-DEAS included GEOMOD, MODAL PLUS, SUPERTAB, SUPERB and SYSTAN. Moreover, the structural optimization program STARS is used.

At the *University of Jyväskylä* the research in the sphere of computational mechanics is being carried out at the *Department of Applied Mathematics* (P. Neittaanmäki). The research projects in this field are

- (a) FEM in contact problems.
- (b) Optimum structural design in contact problems.
- (c) Computation of stresses and strains by post-processing techniques with linear elements.
- (d) Optimization of the water spray cooling in continuous casting of steel.
- (e) Multigrid methods.
- (f) FEM in microcomputers.

The FEM programs used are: ANSYS, INTERLIB (developed by INRIA, France), ELLPACK, and TWODEPEP. Because the research is focused on new methods or special problems locally developed programs have been used.

The *Technical Research Centre* of Finland (VTT) is a polytechnical consultative research establishment dealing with almost all areas of technology. In structural mechanics there are activities altogether at nine laboratories covering different fields of technology such as mechanical and civil engineering, naval architecture, geotechnics and nuclear engineering; both experimental and theoretical work is widely carried out. In addition to the conventional calculations, measurements and testing, VTT has

developed advanced methods in several areas, some of which are

- (a) Arctic technology
- (b) Fracture mechanics and fatigue
- (c) Dynamic measurements

General purpose finite element programs are used in VTT. We mention ADINA, ADINAT, PFEC, SAP VI, PIPEBREAK, JTROCK, CRACK, FEFLOW, MAGENON, COUPLE, STRUDL-II, and FLUSH. For further information contact J. Vanne.

The *Finnish State Computer Centre* (VTKK) at Espoo supports the software development of universities. Moreover, though the computer net, FUNET, the universities can use the software and computers of VTKK. The engineering software of VTKK includes, among others, ADINA, ELLPACK, BASPL, NAGFEM, NASTRAN, PHOENICS, PIGS, SPICE 2, SUPERTAB, and TWODEPEP. For further information contact M. Käpyaho.
