TRANSPARENCY FOR SPONSORED CONTENT

Transparency for sponsored content: Analysing codes of ethics in public relations, marketing, advertising and journalism

Abstract

As sponsored content is gaining ground globally, the boundaries between strategic communication, advertising and journalism are blurring. As sponsored content becomes more common, it raises novel ethical concerns that no industry alone can answer, such as How much disclosure is needed for transparency? Self-regulation via codes of ethics has been suggested as a remedy to meet the rising transparency expectations, and this article analysed 40 codes of ethics in the fields of communication, advertising and journalism (US & Finland) related to sponsored content. The results indicate that there remains excessive variation within the codes of ethics of how transparency of sponsored content is addressed. According to our analysis, most of the codes deal with transparency and the separation between commercial and editorial content only vaguely, and only eight of the total forty guidelines take sponsored content into account. Therefore, we believe that the strategic benefit of sponsored content is threatened as long as no joint codes of ethics exist for sponsored content. To the degree that sponsored content is practiced across professions, we call for a joint code of ethics for sponsored content transparency, as the current codes of ethics fail to answer this emerging need.

Purpose

A new form of strategic communication, sponsored content is gaining ground globally: As the news industry is undergoing changes in its business model and traditional advertising continues to irritate readers and users, there is a steep rise emerging in the amount of use of sponsored content and native advertising by brands and media outlets (Wojdynski & Evans, 2016). Strategic communication can be argued to include most forms of media from public relations and advertising to media relations and marketing (Falkheimer & Heide, 2014;

TRANSPARENCY FOR SPONSORED CONTENT

Hallahan, Holtzhausen, Van Ruler, Verčič, & Sriramesh, 2007). The blended media form of sponsored content has brought along a need to re-consider professional codes of ethics, as the traditionally clear division between editorial and commercial content is diminishing and the source and outlet of sponsored stories are blurred in the eyes of the readers (Hallahan, 2006; Howe & Teufel, 2014). The commercialization of news is controversial despite the vital role of advertising (Wojdyski & Evans, 2016; Yang & Oliver, 2004), and as sponsored content becomes more popular, questions such as ‘How much disclosure is needed for transparency?’ and ‘How can we best balance between non-intrusive and transparent content?’ remain unanswered, as the codes of ethics that could aid in decision making are not updated to match the needs of the current industry development.

Sponsored content is understood by industry as integrating paid-by-the-brand and owned-by-the-brand messaging in journalistic media outlets to achieve strategic goals (Bivins, 2009) to create a positive consumer experience, and currently being tested by major news outlets (Campbell, Cohen, & Ma, 2014). As it becomes more common, the use of sponsored content and related phenomena such as native advertising or brand journalism raise novel ethical concerns (Balasubramanian, 1994; Bowen & Stacks, 2013; Hallahan, 2014; Lock, Seele, & Heath, 2016; Pew Research Center, 2014; Poutanen, Luoma-aho, & Suhanko, 2016; Taiminen, Luoma-aho, & Tolvanen, 2015; Tutaj & van Reijmersdal, 2012; Wojdyski & Evans, 2016). Despite the popularity of sponsored content in practice, its definition remains blurred, and there is an acute lack of research about ethics related to sponsored content. Recently, Tao and Ferguson recommended ”practitioners to nurture a strong desirable ethical reputation for their firms through an integrated, strategic approach” (Tao & Ferguson, 2015, 40), yet for sponsored content, such an ethical reputation would require combining different professions’ views of ethics.

TRANSPARENCY FOR SPONSORED CONTENT

Sponsored content is hybrid by its nature, requiring more cooperation between the media organization and brand than older forms of traditional advertising or marketing. Strategic communication can be argued to include most forms of media from public relations and advertising to media relations and marketing (Falkheimer & Heide, 2014; Hallahan et al., 2007). Sponsored content production involves professionals from several sectors including media business, advertising, journalism, marketing and public relations; yet, these fields have very different understanding of codes of ethics and ethical business practices. Of these fields, the development of sponsored content has been questioned especially by journalists, as sponsored content has often very little to do with traditional journalism despite its media context (Poutanen et al., 2016). Recent research has suggested that strategic communication practitioners should nurture “a strong desirable ethical reputation for their firms through an integrated, strategic approach. Specially, we recommend them to instill business ethics across corporate functions” (Tao & Ferguson, 2015, 40), yet for the emerging phenomenon of sponsored content, several professional ethics need to be combined. Moreover, the inconsistency of the self-regulation of the industries involved may threaten not only reader trust but through it the legitimacy of all parties involved, including businesses, brands, as well as the media industry. This threat cannot be reversed until there is common understanding of what the codes of ethics of these different industries address (Bowen & Stacks, 2013; Hallahan et al., 2007). A more thorough understanding of the ethics of new forms of advertising would help both businesses (brands and organizations) producing sponsored content, as well as the media outlets using native advertising.

This study addresses the urgent need to understand how current codes of ethics created for communication and marketing professionals address content transparency. We ask to what degree do codes of ethics cover both sponsored content and transparency, and whether codes of ethics of marketing, public relations, and journalism differ from each other

TRANSPARENCY FOR SPONSORED CONTENT

substantively on the topic. The article is organized as follows. First, we introduce these new forms of promotional content, such as native advertising, from the angle of transparency and disclosure of commercial interests. Then, we apply qualitative content analysis (QCA) to scrutinize the understanding of transparency in codes of ethics publicly available for analysis online. To gain a comprehensive picture, we focus our analysis on two levels: 1) Global level, and 2) Individual country-level comparison (United States & Finland). These two countries were chosen as a convenience sample of the authors origins, but the choice can be argued to be interesting, as the US remains a pioneer in sponsored content and native advertising, whereas Finland represents a leading country in press ethics, press freedom, media transparency and lack of corruption (Transparency International, 2014). To further illustrate our research, we also compare selected codes formed by professional organizations and some significant media enterprises.

Codes of ethics are chosen as units of analysis, as they are prevalent and pervasive in the industries that use sponsored content: news and entertainment media, public relations, and advertising. Such codes of ethics should be able to provide some guidance about the appropriate and ethical use of sponsored content. However, codes of ethics have been criticised because they can fall behind the development of new technologies or changing industry practices (Bowen, 2004), are often seen as unenforceable (Wright, 1993), too vague to offer specific guidance (Kruckeberg, 1993) or irrelevant when compared to corporate culture (Sims & Brinkmann, 2003).

Altogether, 40 codes of ethics representing these two levels of analysis (global and country) were analysed. The results indicate that there remains excessive variation within the codes of ethics of how transparency of sponsored content is addressed. We categorized our findings according to the degree of which they address 1) the phenomenon of sponsored content and 2) transparency resulting in nine types of codes of ethics ranging from opaque to

TRANSPARENCY FOR SPONSORED CONTENT

transparent. According to our analysis, most of the codes deal with transparency and the separation between commercial and editorial content only vaguely, and only eight of the total forty guidelines take sponsored content into account. Therefore, we believe that this research highlights the urgency of developing new codes of ethics for the sponsored content era. To the degree that sponsored content is practiced across professions, we call for a joint code of ethics for sponsored content transparency, as the current codes of ethics fail to answer this emerging need.

What is sponsored content?

Sponsored content is brand-produced material that takes a similar form and qualities compared to the original content on a publisher's platform often produced in collaboration between the media outlet and the commercial actor (American Press Institute, 2013; Boerman, Reijmersdal, & Neijens, 2012; Riordan, 2014; Tutaj & van Reijmersdal, 2012). The producer may vary between the brand, the media company or both combined (Campbell et al., 2014). There are several paid or non-paid forms that sponsored content can take, native advertising being a central one, defined as "advertiser-sponsored content that is designed to appear to the user as similar to editorial content" (Howe & Teufel, 2014, 79). Some researchers emphasize the organic reach of native advertising and its influence (Campbell et al., 2014). As a phenomenon sponsored content is not new (Balasubramanian, 1994) but is on the rise due to the availability of direct brand-to-consumer communication channels, such as YouTube™ etc.

In fact, sponsored content has been compared to advertorials, referring to advertisement blended with editorial material (Kim, Pasadeos, & Barban, 2001). Similarly, in corporate issues management, as well as the government and NGO side, issue advocacy advertising has been used to ensure a message reaches its audience (Heath & Palenchar, 2009), and even for

TRANSPARENCY FOR SPONSORED CONTENT

reframing a public issue with an ethical context in mind (Bowen, Rawlins & Martin, 2010). For sponsored content, however, the brand is not trying to hide its involvement, though neither does it aspire to advertise the brand behind the text, but instead builds on the engagement of the readers. Overall, sponsored content is understood to involve both paid and unpaid sponsored/branded stories and journalism, paid search results, promoted listings and sponsored recommendations.

Table 1 summarizes the sponsored content and other online forms of brand-related content online.

Table 1. Different forms of sponsored content.

- INSERT TABLE 1 HERE -

Several degrees can be found to the current use of sponsored content ranging from minor collaboration to full integration. Sonderman & Tran (American Press Institute, 2013) distinguish between 1) the underwriting model, where sponsor material is added to regular reporting, 2) agency model, where the media company hires special writers for brand-stories, 3) platform model, where brands have free access to a dedicated media space and 4) the aggregated model, where the brand actively combines real news and journalism with its own material. The four models described here clearly show the blurring of the traditional line between editorial independence and advertising, and hint at changing work processes in media companies (Riordan, 2014). What is only little understood is the extent to which

TRANSPARENCY FOR SPONSORED CONTENT

audiences comprehend what is sponsored content versus what is traditional journalism, thus the ethical issues surrounding this new media form are heightened.

The benefits of sponsored content use for brands and organizations are several. As advertising can easily be blocked, the more subtle formats of brand collaboration have been associated with more positive reactions from readers (van Reijmersdal, Neijens, & Smit, 2005). Less reader irritation means more benefit for the brand (Tutaj & van Reijmersdal, 2012). As banner advertising remains ineffective in addition to being irritating, (Tutaj & van Reijmersdal, 2012) sponsored content aims at being both effective and entertaining.

Ethics of sponsored content

Sponsored content raises ethical concerns for two main reasons: First, the changes occurring in the media landscape lack standards and second, there is a lack of transparency or disclosure with the use of sponsored content. The speed of communication, global scale and reach as well as potential anonymity create a need for professionals to improve the standards of accuracy, honesty and full disclosure (Bowen & Stacks, 2013; Hallahan, 2006). The changing media landscape makes identifying and evaluating of sponsored messages more difficult than in years past (Flanagin & Metzger, 2000; Riordan, 2014). Media literacy of sponsored content is challenging, due to continuous change of the Internet, which resembles multiple media and contains information that differs vastly in credibility (Flanagin & Metzger, 2000).

Transparency itself has many definitions. In its simplicity, transparency is “the perceived quality of intentionally shared information from a sender” (Schnackenberg & Tomlinson, 2016, 1788) the opposite of secrecy. This definition includes the idea that disclosure of information must be perceived properly by the receivers in order for it to be effective. Deriving from Balkin (Balkin, 1999), Rawlins divides organizational efforts to

TRANSPARENCY FOR SPONSORED CONTENT

increase transparency into four elements: informational, accountability, participation, and secrecy (Rawlins, 2008). In the case of sponsored content, especially informational and accountability aspects should be analysed. Transparency is needed to verify the openness of the messages (Baerns, 2004) and “the lack of transparency is a prerequisite for all deceptive acts” (Plaisance, 2007, 203). As for assessment of transparency, Taiminen, Luoma-aho and Tsetsura (2015) created a model for self-evaluating transparency of sponsored forms of public relations (and advertising), where six dimensions are presented: quality requirements, appreciation, disclosure, differentiation, empowerment, and discoverability (Taiminen, Luoma-aho, & Tsetsura, 2015).

Disclosures are a vital part of transparency. Disclosures of sponsored content are difficult to handle properly, since shared messages quickly lose touch with the original source (Synder, 2011), and the “flat” structure of web sites makes realizing context difficult (Riordan 2014). Readers have a certain amount of persuasion knowledge consisting of three dimensions: recognition of advertising; understanding of persuasive and selling intent; and ad skepticism (Tutaj & van Reijmersdal, 2012). The commercial nature of online sponsored content is much less noticed by viewers when compared with banner ads (van Reijmersdal et al., 2005). Previous studies confirm that consumers have not been able to properly identify the commercial nature of advertorials (Erjavec & Kovačič, 2010; Kim et al., 2001), and it is likely that similar problems exist with sponsored content. Even with clear labels about the content, consumers are often not able to tell whether the story they read was editorial or branded content (van Reijmersdal et al., 2005). Research is still looking into whether and with what consequences this confusion actually matters for the individual consumer, the medium and the brand experience.

For ethical promotion, authenticity and respect for the message receiver is needed (Baker & Martinson, 2001). Avoiding deception, eschewing secrecy, disclosing the nature of

TRANSPARENCY FOR SPONSORED CONTENT

content and emphasizing clarity are further encouraged (Bowen & Stacks, 2013). Moreover, specific features for disclosure information including accuracy, timeliness, completeness and reliability are considered vital for transparent persuasion (Rawlins, 2008).

As the practice keeps emerging and re-shaping, legislation and other national regulations have a difficult time keeping up. Self-regulation such as codes of ethics remains the most efficient guidance for ethical practices. To better understand the self-regulation, we next look at the codes of ethics created for professionals dealing with sponsored content on both global and national level. We understand these guidelines as manifest forms of socially constructed reality among media and communication professionals.

Method

A total of 40 codes of ethics related to professions dealing with sponsored content were selected for analysis. Table 2 shows the different institutional levels that regulate sponsored content.

- INSERT TABLE 2 HERE -

Most codes of ethics studied (tables 3 and 4) originate from United States. Between professions, the most codes were found in the area of public relations. Some codes of ethics that were popular and available were left out due to their too narrow or specific focus only on a small area of the function. For example the code of the Mobile Marketing Association was left out, since it was focused on technical aspects of mobile communication and did not state any values or considerations that could be related to this study's research questions. Especially the field of behavioural online advertising has many codes that only deal with technical details. The European Advertising Standards Alliance's (EASA) guide to self-

TRANSPARENCY FOR SPONSORED CONTENT

regulation of advertising was left out since it was not available to the public without payment. Most of the professions' relevant codes are still included, so leaving out technical or unavailable codes did not weaken the validity of the research remarkably. Tables 3 and 4 show the different associations and organizations' whose codes of ethics were analysed.

Included here are also five examples of codes of ethics from media organizations (table 4) because they deal with sponsored content. Four of them are from the news outlets The Atlantic, New York Times, Quartz, and one aimed at members of the Associated Press. These codes were included on the basis that they were from big and popular media enterprises and were available publicly. Media codes offer valuable information when compared to codes of associations. Sadly, only a few media organizations share their codes publicly, especially in Finland, and even a smaller portion of them include anything related to sponsored content or the line between editorial and commercial content.

- INSERT TABLE 3 HERE –

- INSERT TABLE 4 HERE -

This research conceptualizes these ethical guidelines as manifest forms of socially constructed reality for professionals. All codes of ethics were selected based on their reach and popularity of the organization that created them. The study included all publicly available and relevant codes that were used both globally and nationally in the US (industry leader) and Finland (transparency leader).

TRANSPARENCY FOR SPONSORED CONTENT

Analysis

Disclosures of native advertising and sponsored content are the core of this study, so these concepts were searched closely in the content of the selected codes of ethics. This research utilizes qualitative content analysis (QCA), as it enables a deep analysis of content (Schreier, 2012; Tuomi & Sarajärvi, 2009). QCA offers a way to quantify large amounts of material in a detailed and systematic way.

To begin the analysis phase, relevant parts of the codes based on the research questions were selected to be included. This selecting was done using the criteria presented in table 5. The criteria was used to define what information included in the codes was meaningful for this research and should be taken into the study. General expressions of transparency and related concepts were included. In addition to these, also mentions of sponsored and native forms of advertising were searched for. Advertorials were also thought of as important since their production methods might be quite similar to sponsored content.

- INSERT TABLE 5 HERE -

The data was coded twice via Atlas.ti consisting of testing, coding and check-up coding. A coding frame was built first via test-coding of parts of the data (Schreier, 2012), and the coded paraphrases were used to form categories and hierarchies. Table 6 shows the segmenting criteria of the research. The segmenting units were selected based on test codings of small portions of the data.

TABLE 6 Segmenting the data for coding

TRANSPARENCY FOR SPONSORED CONTENT

- INSERT TABLE 6 HERE -

The analysis focused on transparency and aimed to understand the distinctions between sponsored content, native advertising and phenomenon of blurring of advertising and journalism. The analysis focused on following aspects: concept of transparency; separation of ads and original media content; forms of disclosure and labels; work processes when producing commercial content; and sponsored content and native advertising. From these aspects, different extremes were searched for. These extremes formed different types for the codes of ethics. The belonging of a code in one type was then confirmed by reading again the guideline to check for discrepancies.

The paraphrasing done with Atlas.ti resulted in the formation of 556 paraphrases. These paraphrases were carefully sorted into groups based on their similarities. As an outcome, five groups that reside under the one main category, 'Transparency in media content' as visualized in figure 1.

- INSERT FIGURE 1 HERE -

Results

TRANSPARENCY FOR SPONSORED CONTENT

There was great variance among the codes of ethics analysed. Some were very detailed with specific instructions for dealing with commercial content, whereas others only offered general considerations about how a professional communicator should operate. Transparency and sponsored forms of media were addressed in the following contexts: 1) forms of paid content, 2) transparency and disclosure generally, 3) separation of paid and editorial content, 4) disclosing commercial material and 5) work processes. Table 7 shows how the guidelines discuss transparency and the separation of commercial and editorial content.

One important factor in which the guidelines varied was the amount of specificity. Some codes (such as American Society of Magazine Editors' guidelines) were quite exact with precise instructions for even special cases. Others (such as Global Alliance for Public Relations and Communication Management's codes) only stated values that professionals should embrace. Guidelines differed in how they accounted for transparency. Some did not mention the concept or related terms, whereas some paid much attention to describing transparency.

Only eight of the 40 guides discussed native ads or sponsored content. The rest may have touched upon similar issues, but did not elaborate on these concepts. The guidelines were divided by two main dimensions: how 1) transparency and 2) sponsored content are discussed. Using these dimensions as a foundation for the analysis offered essential information about how guidelines discuss sponsored content. The division was formed by looking at different coded categories and combinations of categories apparent in guidelines.

This research found that of the eight organizations with specific code instructions related to sponsored content, all eight used separation as a key guideline; seven held guidelines related to disclosure; seven discussed forms of labels on sponsored content; five

TRANSPARENCY FOR SPONSORED CONTENT

had guidelines about the processes related to sponsored content creation; and, five discussed the influencing power of advertisers towards editors or editorial content.

TABLE 7 Division of ethical guidelines based on how they discuss transparency and the separation of commercial and editorial content

- INSERT TABLE 7 HERE -

Ethical guidelines fall into nine different categories (see table 8). Using these criteria, two categories under the column ‘Sponsored content discussed’ had no guidelines for sponsored content. All of the guides that discussed sponsored content also took the concept of transparency into consideration.

- INSERT TABLE 8 HERE -

To answer the research questions posed in this study, sponsored content and transparency were very seldom addressed in the codes of ethics across professions. Overall, there was a lack of addressing transparency and sponsored content together, and results show how transparency is and is not taken into account on different levels. Results also indicate that sponsored content and native advertising are only being addressed in very few of the guides (eight out of the total 40).

When comparing the codes of the US versus the Finnish codes, difference was found in that all eight organizations with codes of ethics in which transparency of sponsored content was thoroughly discussed were US-based. Culturally speaking, Finland is a world leader in

TRANSPARENCY FOR SPONSORED CONTENT

media transparency, yet Finnish codes failed to offer more frequent or specific guidance than the US codes. Although these findings are unexpected, there are possible explanations for them. Because of the high level of media saturation and innovation in the USA, as well as the business focus of the media industries, it is possible that a higher demand for sponsored content guidance has driven the development of the eight codes we found. Public demand in the US, in addition to business and legal pressure to clarify codes of ethics related to sponsored content, may have also driven the move to address this hybrid form, such as in the case of *The Atlantic*.

When comparing different professions, some differences could be found, often explained through a focus on the core function of the profession. When compared to an average, *public relations' guides had less information regarding separation and transparency*. Advertising and marketing guides varied a lot, so there was not a clear pattern. *Journalism guidelines generally took separation into account*, and there are several guides which also addressed sponsored content. *The guides of media companies addressed separation, but only The Atlantic addressed new forms of advertising*. Especially in the case of media enterprise guides, the lack of addressing sponsored content might have been due to the fact that some of the guides have not been updated for many years. Geographical and occupational background-variables show some differences but were not significant.

According to our analyses, most of the codes deal with transparency and the separation between commercial and editorial content only vaguely, and only eight of the total forty guidelines take sponsored content into account highlighting the urgency of developing new codes of ethics for the sponsored content era. To the degree that sponsored content is practiced across professions, we call for a joint code of ethics for sponsored content transparency, as the current codes fail to answer this emerging need for transparency.

TRANSPARENCY FOR SPONSORED CONTENT

Practical Implications

This research offers many useful insights for practice that could help in achieving a solid ethical culture (Tao & Ferguson, 2015) for sponsored content. First, the results give guidance about creating adequate codes of ethics in the era of sponsored content. When creating codes, the role of transparency in framing sponsored content should be set as a high priority. Second, pursuing income or publicity at the expense of neglecting ethical issues can lead to deteriorated trust among the public (Hallahan, 2014; Howe & Teufel, 2014). This distrust can lead to decreasing profits as readers turn away from distrusted media companies (Cowling, Hadland, & Felix Tabi Tabe, 2008). Conversely, increasing the transparency of media processes may improve the reputation of both the media organization and brand that is advertised, along with the new practice being more ethical. Thirdly, codes of ethics provided by individual media organizations might be a good way to tackle the ethical issues at hand or a lack of transparency about sponsored content. If professional organizations' codes are too slow to adapt to the changing environment, media organizations could take the lead in forming ethical norms. If the ethical issues are neglected for too long, there might be a need for state-level regulation. As illustrated by Bowen's (2006) research on moral autonomy, the industry would prefer self-regulation over laws (Drumwright & Murphy, 2009; Tanyel, Stuart, & Griffin, 2013). Fourth, publishing codes of media organizations could be used as a tool to increase the reputation of the media enterprise and to further the forming of ethical norms. After the Atlantic faced a crisis with their Church of Scientology sponsored content, they quickly reacted by publishing new native advertising guidelines. This kind of public disclosure about media's own working methods can be used to avoid further crises.

Conclusions

TRANSPARENCY FOR SPONSORED CONTENT

Using ethical guidelines represent a way for strategic communication professionals to achieve and fulfill several goals: facilitating social understanding (Bowen, 2010), helping to make more responsible organizations, citizens, and governments (Bowen, 2011), and enhancing organizational effectiveness (Grunig, 2000). As sponsored content is mixing the classic divisions between editorial content and advertising, the important role of ethical guidelines is more vital than ever. Our study shows that only 8 of the 40 codes of ethics we studied addressed sponsored content. It is clear that the industries involved are not responding to new and emerging forms of sponsored content as rapidly or responsibly as they should. Codes of ethics are practical guidelines that should be adopted to aid the industries involved in creating and relaying sponsored content, and guidance in practice is warranted.

As it was noted, different disciplines in media and communication have varying strategic goals that they strive for (Bivins, 2009), and their codes of ethics emphasize different values (Roberts, 2012). For all of the professions, codes of ethics function as guiding principles for practitioners as well as a marketing tool used to convince public and legislators that the discipline is operating in an ethical manner and that it can be trusted. Journalistic and media codes are used by journalists and media companies (i.e. the management and editors of media enterprises). For them the codes represent a way to ensure quality of the editorial content and advertising which they are providing for their customers, i.e. the public. As more customers bring more advertising revenue, upholding editorial standards is desirable, and maintain the ethical standards of advertising is morally commendable but also prevents legal woes.

Ethics codes can protect the communication professions from unfair competition in which a rival practitioner would use unethical means for more effective persuasion. Codes differ for the persuasive professions as compared to journalists. A journalist usually works for a media company and is also seen as serving the public interest with his/her work. Persuasive

TRANSPARENCY FOR SPONSORED CONTENT

communicators operate in various positions: they might be working for a brand in-house or via a communication agency, and their work is mainly focused on serving their clients' needs. Due to their differing lines of work these professionals also need different kinds of codes. Ethical guidelines can also be directed at organizational leaders who might not possess a professional communicator's background. So the codes also have to acknowledge the varying background knowledge and education of the people using them. As mentioned earlier, the ethical burden of using sponsored content is on the creator of the message, as well as the media outlet relaying it, rather than on the audience. One cannot assume a media literate message receiver when using sponsored content, and thus the ethical burden is on the producer of the message. Effective codes of ethics should introduce moral norms to ensure that the rights of consumers are respected. Both brands and media companies do not want to lose credibility because of ethical pitfalls, and the ethical codes serve as a critical intermediate in guiding actions.

The complex nature of sponsored content has its implications also on the different professions and the individual practitioners involved. As sponsored content combines a hybrid of professions and practices, no single profession can alone produce full transparency. Only through combining the views of strategic communication, advertising, public relations, journalism, and the media industry can we establish full transparency and disclosure of sponsored content. Better self-regulation could be achieved by integrating some universal cross-industry norms into the existing codes. A more radical, though urgently needed, enhancement would be to form a joint code of ethics for sponsored content transparency. As this development may be unrealistic and take time as professional identities and production units and departments often remain separate, we call for all related professions and industries to increasingly collaborate and monitor also other fields' development on the topic.

TRANSPARENCY FOR SPONSORED CONTENT

Limitations and future studies

As this study focused on manifest meanings of the codes of ethics, evaluating face and content validity is enough (Schreier, 2012). This research reached sufficient validity, as the research questions were examined by using a suitable method, qualitative content analysis which provided answers to questions posed. Face validity of the coding frame was sound, since the coding frame worked well and different categories did not contradict each other. Content validity of the frame was also good, since the method provided a precise portrayal of the topic at hand.

This study has several limitations. First, it does not offer information about how codes of ethics are applied in practice, and whether professionals adhere to them or not. This is a major deficiency when considering the topic and the research gap. A triangulation of different research data and methods (for example interviewing managers at media enterprises) would have provided a more complete image about the state of ethics in the industries, and should be undertaken by future research. Moreover, future studies should continue to cut across the artificial discipline boundaries to fully analyze the phenomenon of sponsored content.

Second, as we used a convenience sample of two nations, we did not include codes of ethics which are written in other languages than English or Finnish, though many of the codes globally fall outside these language categories. Our cross-national comparison delivered results that were skewed in favor of the US as a media-leading nation. Comparing the codes of many nations and languages related to disclosure and transparency in sponsored content would allow for more nuanced cultural understandings to emerge. Despite these limitations, this study serves as a starting point for understanding how codes of ethics address transparency and disclosure of sponsored content.

Table 5

Selection criteria for the relevant parts of codes of ethics

WHICH PARTS OF THE CODES WERE SELECTED?	
General criteria	Detailed criteria
Transparency and related concepts, as general expressions of values	
Disclosures of advertising	Mixing of editorial and advertising Labels, disclosures, disclosing/identifying the marketer/advertiser, identifying the producer of content Who has produced the content Hidden advertising Media literacy / The ability of consumers to recognize content Journalistic process and creating advertisements
New forms of advertising online and blurring practices	Sponsored or branded content Native Advertising Blurring of editorial and advertising Advertorials
TO BE LEFT OUT	
General criteria	
General statements of values (except transparency and related concepts)	
Transparency in the traditional journalistic process (checking and referencing sources etc.)	
Participation, if not directly related to transparency of advertising	

TRANSPARENCY FOR SPONSORED CONTENT

Table 6

Segmenting criteria for coding the data

Units for coding	Selection criteria
Sampling unit	Relevant parts selected from 1 code of ethics. See criteria in table 5.
Coding units	Selected by propositional distinctions. A coding unit is formed out of one argument related to one issue. It can be a few words, a sentence, or multiple sentences. Multiple units may be formed out of a single sentence.
Context unit	One paragraph / One article of the guideline
